

Peacock Appearance

Despite their colorful appearance, peacocks have a loud and disruptive call. It is because of the crystal-like structures embedded in their feathers, which reflect different wavelengths of light based on their spacing. Their iridescent feathers change color depending on the amount of light and angle.

A peacock's tail makes up 60% of its entire length. They have an inch-long beak adapted for preying on small creatures like insects. Even though peacocks are widely seen in many Asian countries, they are dominant in India, Sri Lanka and Myanmar.

Live your life like a [peacock eating](#) smashed french fries on the sidewalk: be pretty, but also eat garbage. Lizard and frogs have high protein content for peacocks. They like eating insects such as ants, flying insects, grubs, or even any other bug.

This is one of favorite food of peacock. Once they reach a mature age, you may transition the peafowl to standard peafowl feed. If you keep peafowl from young chicks, you can feed them with the peachicks starter feed that is un-medicated.

However, if that peacocks are used to being fed with snakes, then it will also become habit. Peacocks that live in their native habitat, in the forest for example, will probably consume snakes. In India, people usually call this bird as Mayura which means 'the killer of snakes'.

Peacocks are also known to prey on venomous snakes. Many poultry hobbyists who keep peafowl in their backyard usually feed them with grain such as oats or corns. The favorite food of peacock can be said everything which is on their food list, especially food they find on the ground.

Moreover, they tend to eat insects and animals as well as vegetation since they have high protein dietary requirements. The peacock food depends on the various factors such as the anatomy and habitat. However, for some species of peacock can be kept or raised as exotic pets.

Second, green peacock from Southeast Asia. First, the Indian peacock which is native to India and Sri Lanka. There are three peafowl species in the world.

The other evening they were both in the library—Jack sleeping before the fire—Tom Quartz scampering about, an exceedingly playful little wild creature—which is about what he is. He would race across the floor, then jump upon the curtain or play with the tassel. Microscopic crystal-like structures” that reflect different wavelengths of light depending on how they're spaced, resulting in bright fluorescent colors Hummingbirds and shimmering butterflies have

mastered a similar visual effect on their own wings. 9. Their feathers are covered in tiny crystal-like structures.

In fact, one-third of the calls heard by researchers were fake, and the birds that made them scored the most hookups. These birds aren't just nice to look at, they're also clever, according to one recent study. It was tough and coarse, and was criticized by physicians for being difficult to digest and for generating bad humors," writes Melitta Weiss Adamson in her book *Food in Medieval Times*.
