Load or start a new game on save file A.

Don't press L, R, X or A except:

- Press A to commit Mario's x coordinate (shown in the coin counter) to the installer index (the bonus star count). This will also advance the installer index.
  - Note that the bonus star count will show 0-99 for 100-199, you just have to know which part of the installer you're at. It starts at 0, and not 100.
  - There will be glitched out "tens digits" for the index counts once you get to index 200+.
- Press X to rewind one installer index if you made a mistake at that index.
- Press L and then R to disable enemy spawning until you leave the level.

Enter Yoshi's Island 2 and find a big open area where you can move around to enter the installer code.
