

# Unit 3 AOS 1: How do physicists explain motion in two dimensions?

In this unit students use Newton's laws to investigate motion in one and two dimensions. They explore the concept of the field as a model used by physicists to explain observations of motion of objects not in apparent contact. Students compare and contrast three fundamental fields – gravitational, magnetic and electric – and how they relate to one another. They consider the importance of the field to the motion of particles within the field. Students examine the production of electricity and its delivery to homes. They explore fields in relation to the transmission of electricity over large distances and in the design and operation of particle accelerators.

Unit 3 Area of Study 1 review			

## Unit 3 AOS 2: How do things move without contact

Field models are used to explain the behaviour of objects when there is no apparent contact. In this area of study, students examine the similarities and differences between three fields: gravitational, electric and magnetic. Students explore how positions in fields determine the potential energy of, and the force on, an object. They investigate how concepts related to field models can be applied to construct motors, maintain satellite orbits and to accelerate particles including in a synchrotron.

## Unit 3 AOS 3: How are fields used in electricity generation?

The production, distribution and use of electricity has had a major impact on the way that humans live. In this area of study, students use empirical evidence and models of electric, magnetic and electromagnetic effects to explain how electricity is produced and delivered to homes. They explore the transformer as critical to the performance of electrical distribution systems in minimising power loss.

## Unit 4 AOS 1: How has understanding about the physical world changed?

In this area of study, students learn how understanding of light, matter and motion have changed over time. They explore how major experiments led to the development of theories to describe these fundamental aspects of the physical world.

When light and matter are probed, they appear to have remarkable similarities. Light, previously described as an electromagnetic wave, appears to exhibit both wave-like and particle-like properties. Findings that electrons behave in a wave-like manner challenged thinking about the relationship between light and matter.

Chapter 11 review			

## Unit 4 AOS 2: How is scientific inquiry used to investigate fields, motion or light?

Students undertake a student-designed scientific investigation in either Unit 3 or Unit 4, or across both Units 3 and 4. The investigation involves the generation of primary data relating to fields, motion or light. The investigation draws on knowledge and related key science skills developed across Units 3 and 4 and is undertaken by students in the laboratory and/or in the field.

When undertaking the investigation students are required to apply the key science skills to develop a question, state an aim, formulate a hypothesis and plan a course of action to answer the question, while complying with safety and ethical guidelines. Students then undertake an investigation to generate primary quantitative data, analyse and evaluate the data, identify limitations of data and methods, link experimental results to scientific ideas, discuss implications of the results, and draw and evaluate a conclusion in response to the question. Students are expected to design and undertake an investigation involving one continuous independent variable. The presentation format for the investigation is a scientific poster constructed according to the structure outlined on page 13 of the study design. A logbook is maintained by the students for record, assessment and authentication purposes.

### Chapter 12 - Scientific Investigations

12A		<ul style="list-style-type: none"> <li>explain the characteristics of the selected scientific methodology and method including: techniques of primary qualitative and quantitative data generation relevant to the selected investigation; and appropriateness of the use of independent, dependent and controlled variables in the selected scientific investigation</li> <li>discuss the nature of evidence that supports or refutes a hypothesis, model or theory</li> </ul>	<ul style="list-style-type: none"> <li>The scientific method</li> <li>Variables, types of data, and characteristics of data</li> <li>Theories, models and laws</li> </ul>
12B	Scientific conventions	<ul style="list-style-type: none"> <li>apply the conventions of science communication: scientific terminology and representations; symbols, equations and formulas; standard abbreviations; significant figures; and units of measurement</li> </ul>	<ul style="list-style-type: none"> <li>Units of measurements</li> <li>Significant figures</li> </ul>

## VCE UNITS 3&amp;4 – Physics

12C	Collecting data	<ul style="list-style-type: none"> <li>identify and apply concepts of accuracy, precision, repeatability, reproducibility, resolution and validity of data; and the identification of, and distinction between, error and uncertainty</li> <li>model the scientific practice of using a logbook to authenticate generated primary data</li> </ul>	<ul style="list-style-type: none"> <li>Precision, accuracy &amp; resolution</li> <li>Error &amp; uncertainty</li> <li>Validity, repeatability &amp; reproducibility</li> </ul>
12D	Representing and analysing data	<ul style="list-style-type: none"> <li>apply methods of organising, analysing and evaluating primary data to identify patterns and relationships including: the physical significance of the gradient of linearised data; causes of uncertainty; use of uncertainty bars; and assumptions and limitations of data, methodologies and methods</li> </ul>	<ul style="list-style-type: none"> <li>Plotting data</li> <li>Drawing straight and curved lines of best fit</li> <li>Calculating the gradient</li> </ul>
12E	Communicating findings	<ul style="list-style-type: none"> <li>explain the key findings and implications of the selected investigation</li> <li>apply the conventions of scientific poster presentation, including succinct communication of the selected scientific investigation, and acknowledgement of references</li> <li>identify the physics concepts specific to the investigation and explain their significance, including definitions of key terms and physics representations</li> </ul>
