Alpha drop

The Global Dollar Network (GDN) is cooking something major for stablecoin adoption.

Think Paxos + Kraken + Robinhood + Galaxy + more.

One mission: make stablecoins actually work for the people.

Let's unpack this new stablecoin meta oglobal_dollar

2/

Meet USDG – the "Global Dollar"

A 1:1 backed stablecoin issued by Paxos (Singapore).

Regulated, boring (in a good way), and fully redeemable.

No funny business. Just digital dollars onchain.

3/

GDN isn't some random DAO

It's a consortium of heavyweights:

Kraken

Galaxy Digital

Bullish

Anchorage

Nuvei

Robinhood

Paxos

Collectively repping 40M+ users globally.

4/

Live on Ethereum, Solana, and now... Ink

Yep, multi-chain gang.

Low fees, composability, and real DeFi rails.

Builders, this one's for you.

5/

Here's the twist — you get the yield

Unlike USDT or USDC that keep all reserve earnings,

GDN shares the yield with its ecosystem.

Hold, mint, or integrate USDG \rightarrow earn yield.

Web2? Dead.

Web3? Revenue-sharing stablecoins = future.

6/

Enterprise-grade but crypto-native

USDG is regulated by MAS (Singapore's apex fintech body).

Monthly audits. Full transparency. Institutions get their compliance, degens get their freedom. 7/ Use cases = endless Global payments On/off ramps DeFi liquidity Cross-border B2B DAO payroll One stablecoin to rule them all. 8/ Why this slaps: Most stablecoins extract. USDG rewards. It's the first time CEXs, fintechs, and platforms get a cut of the action — just for integrating. No gatekeepers. No middlemen. Just aligned incentives. 9/ What's next? More partners. More chains. More rewards. If you're building anything that touches payments, treasury, or yield—tap in early. You'll thank yourself later. 10/ TL;DR Global Dollar Network might just flip the stablecoin script: Regulated Multi-chain Yield-sharing Big backers

↑ Keep an eye on \$USDG. We're early. @global dollar
