

How To Install a Magento 2 Extension

1. Upload the Magento 2 extension files to your server.
2. Extract the *.zip* extension file.
3. Verify and copy the Magento extension files into the **app/code** folder.
4. Install the Magento 2 extension and check its status.
5. Clear Magento cache and disable maintenance mode.

Before you install a Magento 2 extension, make sure you backup your server, set pre-install file permissions, enable developer mode, and put Magento in the maintenance mode.

Step 1: Upload the Magento 2 Extension Files to Your Server

Log in to your Magento server as the file system owner.

Upload the *.zip* archive file to a new folder inside your user's home directory using SSH or SFTP.

Step 2: Extract the .zip Extension File

Extract the *.zip* extension file into a new folder called **extension** using:

```
$ unzip redtrack-magento.zip -d /home/magento/extension
```

Once you finish the extension installation process, you can delete this folder using:

```
$ rm -R /home/magento/extension
```

Step 3: Verify and Copy the Magento Extension Files Into the app/code Folder

Verify the extracted component file structure meets Magento's required "vendor/module-name" format.

Navigate to the Magento project root directory and copy the extension files to the **app/code** folder using:

```
$ cp -R /home/magento/extension/* app/code
```

The **app/code** directory doesn't exist in the default Magento filesystem. If this is your first attempt to install a Magento extension manually, create the directory using:

```
$ mkdir app/code
```

Step 4: Register the Magento 2 Extension and Check Its Status

Complete the Magento 2 extension installation process by executing:

```
$ php bin/magento setup:upgrade  
  
$ php bin/magento setup:di:compile  
  
$ php bin/magento setup:static-content:deploy -f
```

```
magento@demo-m2:/var/www/httf$ php bin/magento setup:di:compile  
Compilation was started.  
Plugin list generation... 9/9 [=====] 100% 42 secs 434.0 MiB  
Generated code and dependency injection configuration successfully.  
magento@demo-m2:/var/www/httf$ php bin/magento setup:static-content:deploy -f  
  
Deploy using quick strategy  
frontend/Magento/blank/en_US          2265/2265          ===== 100% 5 secs  
adminhtml/Magento/backend/en_US       2934/2934          ===== 100% 2 secs  
frontend/Magento/luma/en_US           2281/2281          ===== 100% 2 secs  
  
Execution time: 10.949710130692  
magento@demo-m2:/var/www/httf$
```

The “setup:upgrade” command registers the Magento 2 extension and updates the Magento database schema and data. The subsequent commands compile Magento code and deploy static view files.

Note: You don't need to deploy static view files in developer mode unless your extension developer's documentation mandates it.

Verify the status of the extension:

```
$ php bin/magento module:status RedTrack_UniversalScript
```

If it's disabled, you can enable it using:

```
$ php bin/magento module:enable RedTrack_UniversalScript  
--clear-static-content
```

Step 5: Clear Magento Cache and Disable Maintenance Mode

Clear the Magento cache using:

```
$ php bin/magento cache:clean
```

```
$ php bin/magento cache:flush
```

```
magento@demo-m2:/var/www/html$ php bin/magento cache:clean  
Cleaned cache types:  
config  
layout  
block_html  
collections  
reflection  
db_ddl  
compiled_config  
eav  
customer_notification  
config_integration  
config_integration_api  
full_page  
config_webservice  
translate  
vertex  
magento@demo-m2:/var/www/html$ php bin/magento cache:flush  
Flushed cache types:  
config  
layout  
block_html  
collections  
reflection  
db_ddl  
compiled_config  
eav  
customer_notification  
config_integration  
config_integration_api  
full_page  
config_webservice  
translate  
vertex  
magento@demo-m2:/var/www/html$
```

Follow [Adobe's guide](#) to set permissions for a production file system. Then, disable maintenance mode using:

```
$ php bin/magento maintenance:disable
```
