

In order to support ODM, implement the pre-release version of the App Ads On-Device Conversion Measurement SDK.

Step 1: Add `GoogleAdsOnDeviceConversion` as a dependency.

If your app uses Cocoapods:

- Update your project's Podfile with the following:

None

```
pod 'GoogleAdsOnDeviceConversion'
```

- Then run command `pod install --repo-update`

If your app uses Swift Package Manager:

- In Xcode, select File > 'Add Packages' to add:
 - <https://github.com/googleads/google-ads-on-device-conversion-ios-sdk/>

Note: Ensuring Accurate First Open Event Measurement with Tenjin & Google SDK

To ensure Google's SDK has sufficient time (usually under 1 second) to generate necessary information for accurate first open event measurement by Tenjin, introduce a delay between Tenjin SDK initialization and the connect call. A 1–3 second delay is a suggested conservative measure.

Swift

```
[TenjinSDK initialize:@"<SDK_KEY>"];  
// A delay of 3 seconds happens here  
[TenjinSDK connect];
```
