Tutorial to solved the problem related to:
“Invalid Swift Support - The SwiftSupport folder is missing. Rebuild your app using the current public (GM) version of Xcode and resubmit it.”

Hello, my name is Isaac and after search a lot o got solved this problem. I’m use Xamarin and I’ve made this tutorial to help those that have been racked brains. Sorry by my english, how can you see my xamarin studio is translated to portuguese that is my native language. However, i believe that the options are in the same position to you guys.

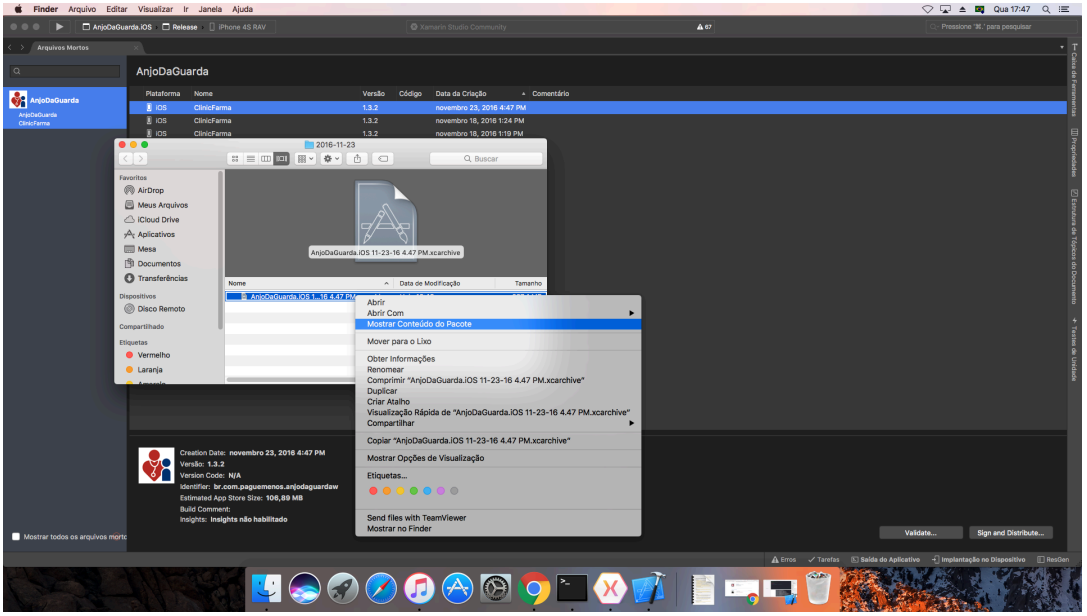

1) Go to archiving

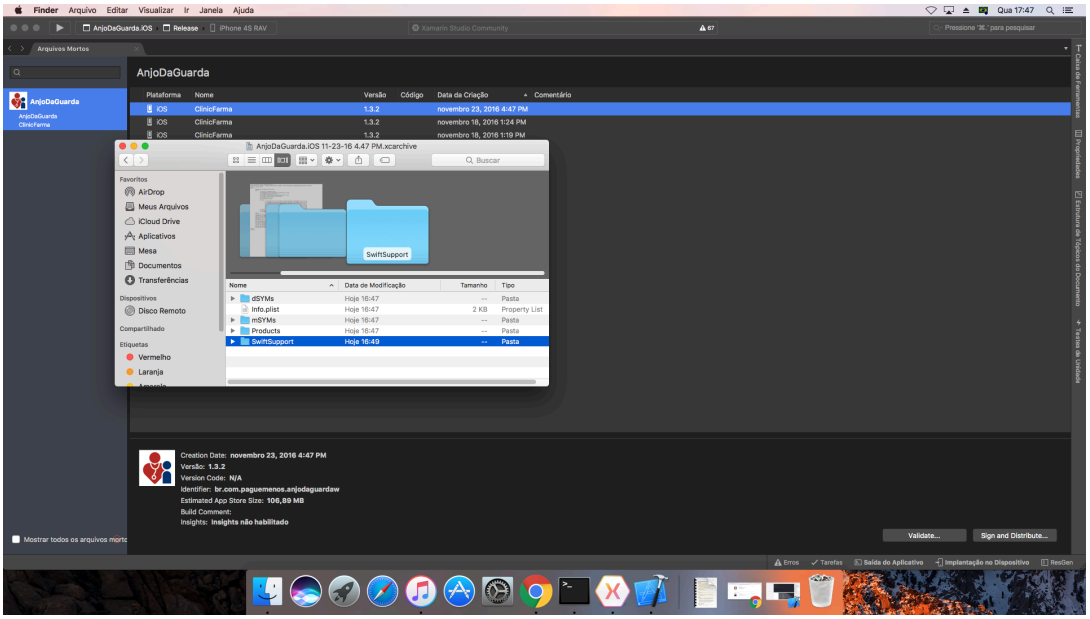

2)Select the right build and version and show it in finder:

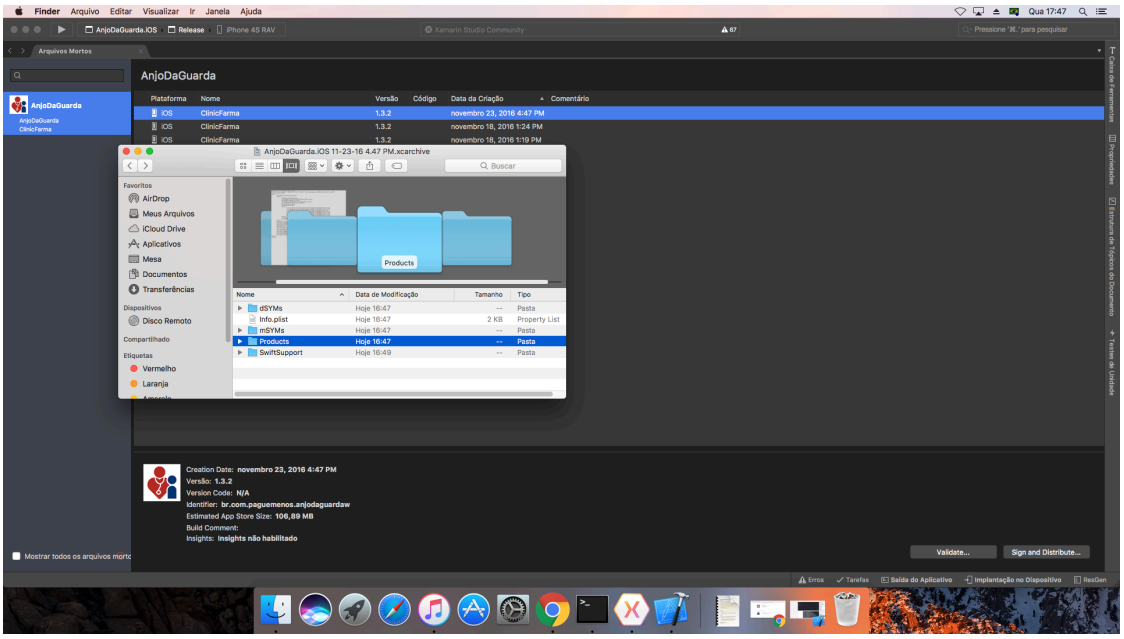

3)Select the archive and show the archive's content

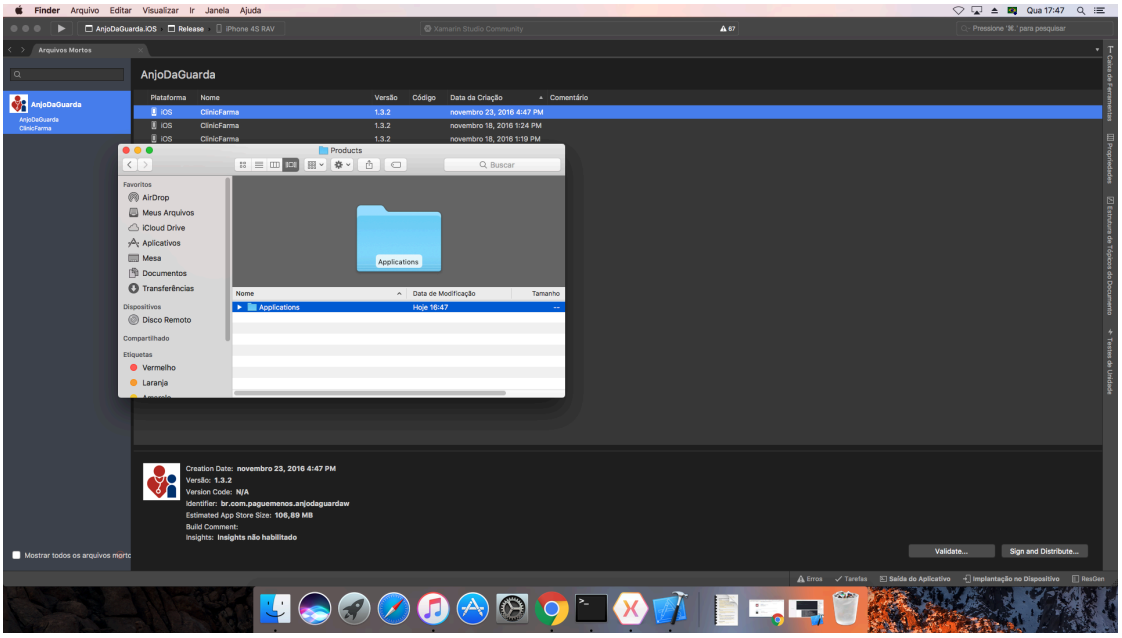

4)After you open. A screen like this above will appear, with only one exception, the folder "SwiftSupport" will not appear. You will create this folder.

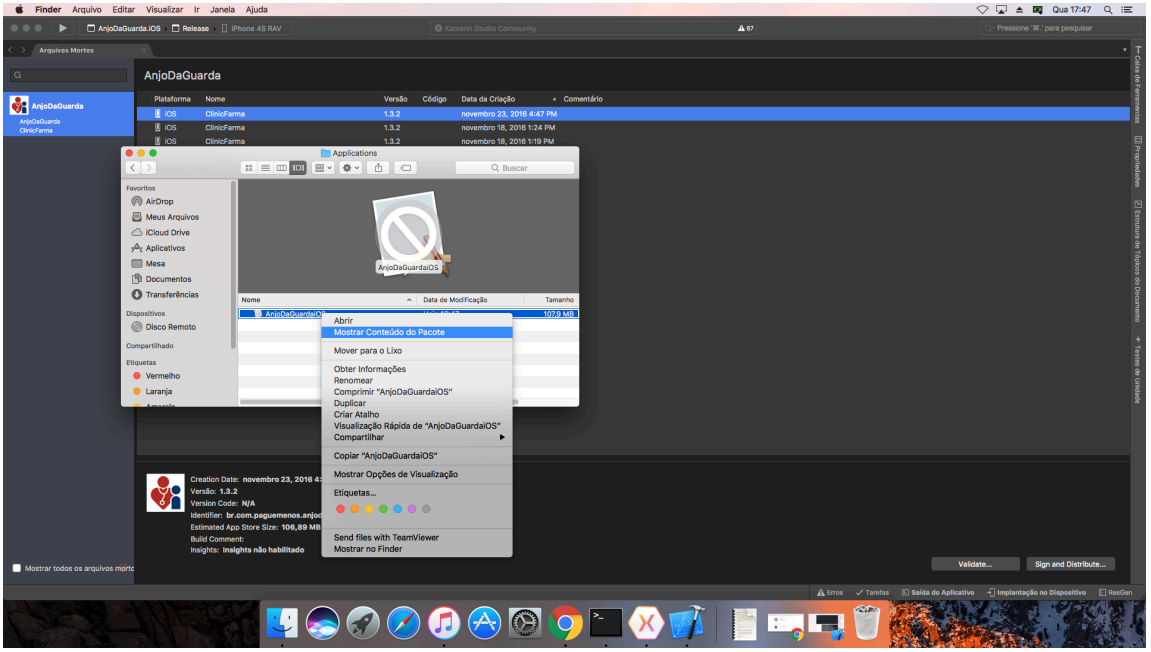

## 5) Now enter in Product folder

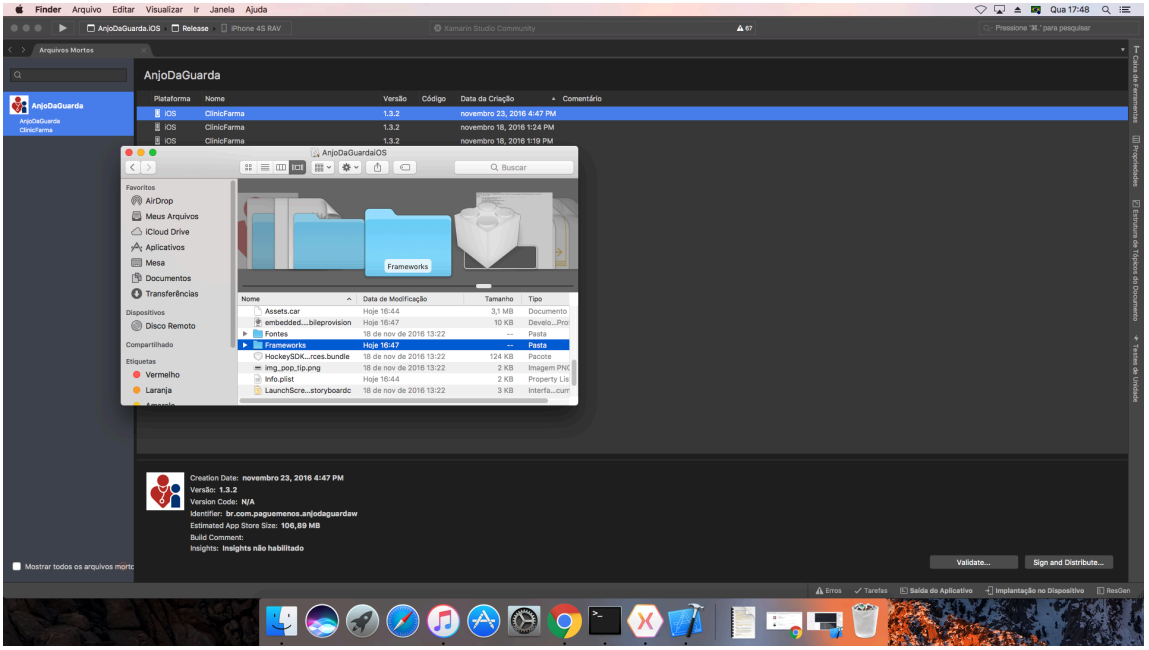

## 6)Enter in Application Folder

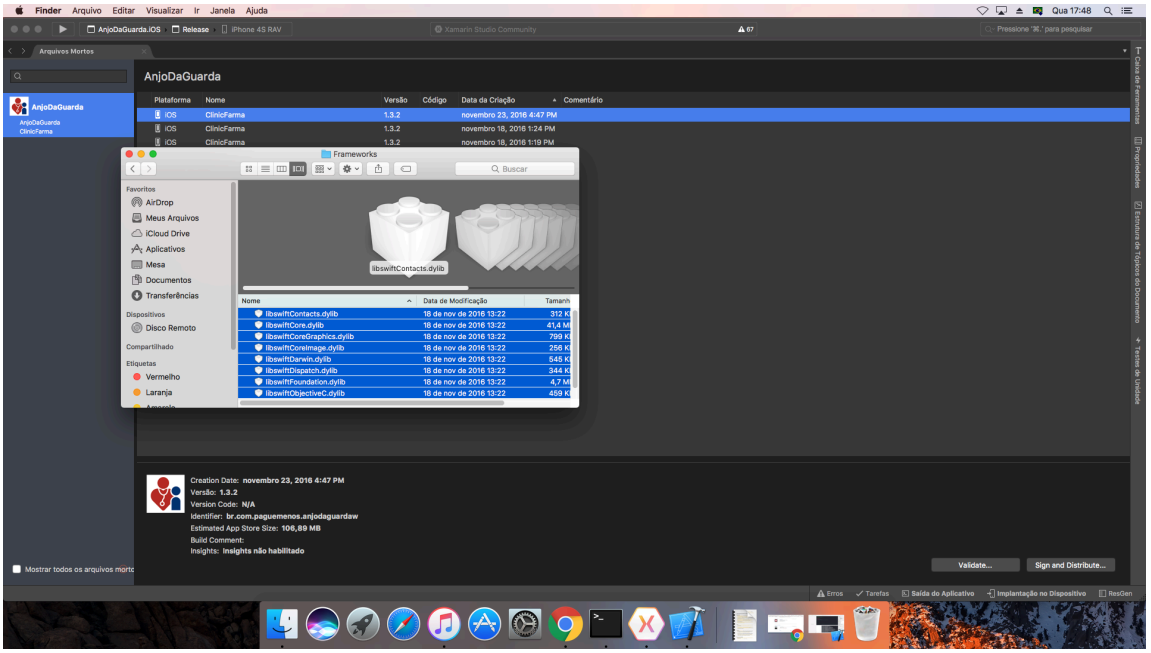

7)You will see a new .xcarchieve file. Right click and choose show content of file

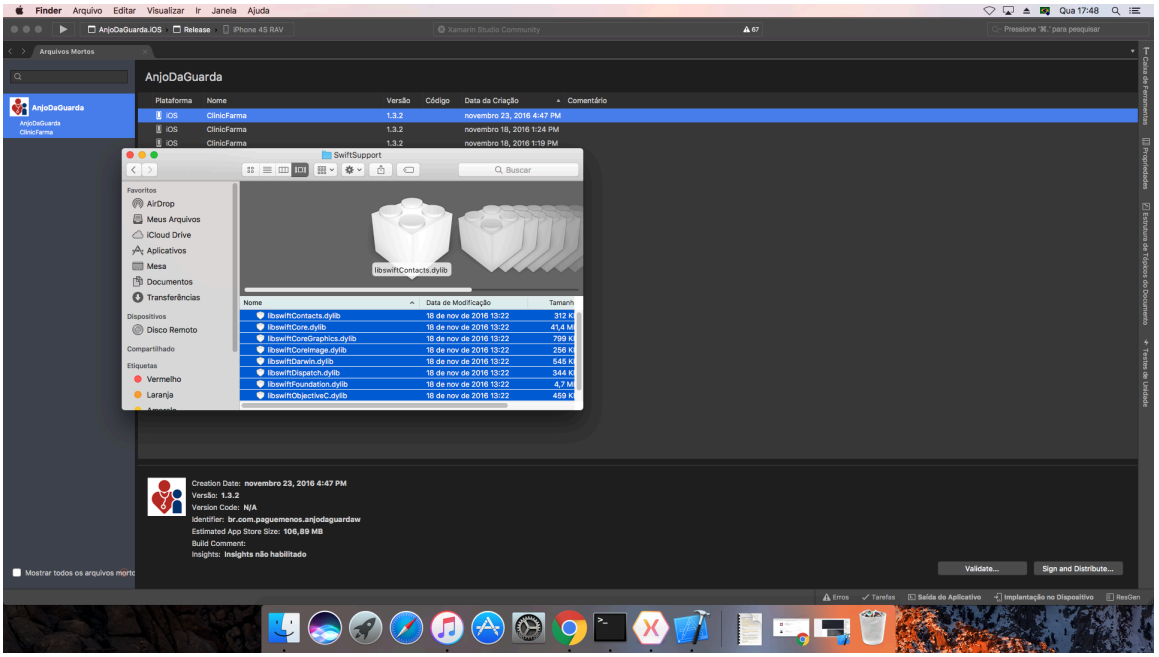

8)Open the folder named “Frameworks”

9)Copy all files within Framework folder

10)Paste all files copyed within SwiftSupport folder, created on step 4

Done. This should be enoght.
Any doubts please contact me cavalcante.isaac1@gmail.com

Thank you.
