Team Rowlf - Ryan May, Jason Wesson, Michael Williamson

Progress Demo # 1

Framework

We're starting with using the Create-React-App as a foundation, and will be doing research into either using Material-UI or BootStrap, but that decision won't be made until later today.

Technologies

We'll be creating unit and end-to-end tests using Jest. We will not be investigating into a CI until we've already created a series of tests for each of our components.

Design Features

Using a CSS framework to accomplish clean design components like carousels and accordions for a smooth look. Ryan also is excited to implement some features for Reviews & Ratings that he hasn't had the opportunity to implement in previous projects, so stay tuned!

Stateful React

We decided to stick to having a stateful app, as we've noticed that the data we're retrieving from the API is not overwhelming, and if necessary, we'll be able to use Functional Hooks instead.

Things We Will Be Researching Still

We'll be looking into the accessibility guidelines on the forefront so that we're aware of how we want to design our components to be more user-friendly and engaging.

Next Steps
