

Frog habitats

Different species of frogs live in different **habitats**. A habitat is the natural place where an animal lives. Many frogs live in forests—especially **rain forests**. A rain forest is a hot, thick forest in a tropical region. Rain forests receive at least 80 inches (203 cm) of rain each year. Some frogs live

in **grasslands** and in deserts. Most frogs live close to water, however. They live near creeks, ponds, streams, and **wetlands**. A wetland is an area of land that is **waterlogged**, or soaked with water, for part or all of the year. Marshes and swamps are two types of wetlands in which frogs live.

*Many frogs live in or near bodies of water such as lakes, rivers, ponds, and **bogs**. A bog is wet, muddy ground.*
