Save Big On Solar Panels Cost

Have you been thinking about setting up [solar panels](#) for your home, but gotten discouraged because the solar panels cost happens to be too large? With the help of proper design and system sizing methods the cost of solar power systems will be considerably lowered. Additionally you can easily save in the vicinity of 40% on the cost of a solar power system by getting a kit and installing it yourself.

To start with you must decide to go with a grid-tied system or an off-grid system. One of the leading advantages of a grid-tied system is that you never have to purchase batteries. The batteries are generally expensive not to mention they need routine maintenance and they have to be replaced every so often. You might also decide to set up a smaller sized, less pricey system in order to decrease your solar panels cost. Given that you're still on the grid the small-scale system only needs to provide only a portion of the electrical power. On the downside grid-tied systems provide no electrical energy when the power grid is down.

The second step to planning your solar power system is to evaluate rebate options and acquire permits. Your area power utility company has rules you'll want to comply with when hooking up the finished system to the grid, and building codes may likewise apply. In conjunction with federal incentives, states (and certain cities) offer refunds that can help with the price of the system. Finding out the rules in your region before you start will certainly save you frustration later on. Check out the Database of State Incentives for Renewable Energy (DSIRE) for information and facts dealing with rebates in your state. It's also a good idea to learn about net metering guidelines where you live, which include how much money you can get paid for generating excess power.

Choosing the size of your system is the next step. With a grid-tied system, size is less significant, due to the fact the grid supplies electric power whenever your photovoltaic (PV) system falls short. Solar power systems no more than a couple hundred watts have proven to be practical, however you can also set up solar panels that will be able to generate enough electrical energy for all your needs. Review the amount of electrical power you use now, then calculate what you will likely be able to save as a result of implementing conservation and efficiency measures throughout your house. This approach is going to provide you with a better understanding of how big a system you'll need to build. You may build any size system you want, even so it may not pay to put in a bigger one. A scaled-down system will hold your solar panels cost down.
