

# Technical Co-Founder Opportunity

---

**TL:DR:** I'm searching for a technical co-founder to build x, an AI-powered end-to-end workflow automation tool for the US law industry. The solution helps lawyers, attorneys and paralegals become 10x more productive by removing manual and repetitive tasks. The ideal co-founder is a strong full-stack engineer who has explored building products powered by GenAI.

## About X

X is dedicated to revolutionizing the workflow for immigration processes. Through our AI-enhanced platform, we significantly reduce the time attorneys spend drafting legal documents and filling out forms, freeing them up to focus on important tasks like consulting new customers or strategizing over complex cases. Immigration firms that adopt X experience a boost in the efficiency of their lawyers and paralegals, enabling them to expand their operations without the need for additional hires.

## About "You"

I have led GTM and Growth at Company A (Global B2B Document Automation Platform) where I helped large enterprises in the US embrace document automation. I was also early at Company B where I spent 5 years in a number of operational, strategic and product roles. I have intimate experience with the US immigration processes. I have applied for more than 6 visas to the US and have seen firsthand how suboptimal the immigration processes are. That's how I got the idea that there must be a better way.

## The Co-founder opportunity

Some of the biggest AI companies are being built right now. As a technical co-founder you will have the opportunity to work on the most exciting technology of our lifetime. The best AI solutions solve end-to-end workflows and combine traditional software with AI and best practices within LLMs (Prompting, fine-tuning etc.). While I have built the v0.1 of the product, I seek a technical co-founder to co-lead the product's advancement.

## ✓ Responsibilities

- Work closely with me to build and ship an LLM-powered product
- Define & implement best practices of how we build LLM-powered products
- Help evaluate and productize various types of LLMs for our product use cases, including fine-tuning as needed.
- Research and stay current with the latest news, tooling, and techniques in NLP such as advanced prompting & chaining, function calling, embeddings, evaluations, etc.

## 🔧 Role Requirements

- 2-3 years of professional experience in AI/ML with a proven track record.
- Experience building web applications with front-end languages like HTML, JS and React
- Ideally based out of NYC or able to relocate as we build out the company (ability to work remote later on)
- Experience building and shipping applications built on top of LLMs into production and evaluating & improving performance over time after deployment.
- Experience with optical character recognition and taking structure information from images
- Well-developed sense through experience of what works and doesn't work when building applications on top of LLMs.
- BS/MS in Computer Science, Artificial Intelligence, Machine Learning, or related fields.
