

## Doji Ashi - Trading View Indicator and Strat Scripts

So sorry about the formatting on Reddit. Here are both scripts (the indicator and strategy) so you can fully test this script for yourself. Currently the BUY signals are 80-90% accurate, whereas the SELL signals are around 40-50%.

I have been testing this script with live trades through Deribit for a few months now and have had a lot of success if focusing solely on BUY signals, taking trades of 1% at a time. My stop losses are 6 candles... aka I hold no trade longer than 25 minutes.

THIS SCRIPT IS NOT PERFECT AND I AM NOT CLAIMING TO BE A GENIUS.  
It just had enough potential that I wanted to see if the community could make it even better.

This isn't a scam. The code is right there for you to use however. All I ask is that you share your results if successful so we can refine this together.

This is not financial advice, please use at your own discretion... blah blah blah.

For successful returns I have been:

- Trading ADA/USDC Futures using Deribit.
- Set the script up on the 5minute chart (the script is written specifically for this chart only)
- Setup a BUY alert on the 5min chart / to alert "once per bar close"

- When an alert comes through I buy 1000 shares per \$50 on account. So if you have \$100 on your account, you can safely buy 2000 of ADA/USDC futures.
- Set a limit for 0.001 from the purchase price.... So if you purchased at 0.6110, set a sell for 0.6120. This will return approx 1%
- Set yourself a stop loss of 6 bars/candles (25 minutes).

## **Breakdown of how the script works:**

A signal is allowed only if **ALL** of these filters are true:

- RSI < rsiOversold
- MTF 10m RSI < rsi10mOversold (if enabled)
- Volume spike (if enabled)
- No price exhaustion (if enabled)
- Not during volume spike suppression

Also:

- A **cooldown** (in bars/candles) must have passed since the last signal

Feel free to test all other filters in the settings (such as the 3min confirm, bull candle indication...etc). I've had varying results, but the default setup is my most successful.

## **Indicator (pine script)**

```
//@version=6
indicator("Doji Ashi v0.1", overlay=true)
