

Cloud Computing has Commenced this world as a Cachet. Increasing the Credibility and Capability in different Common life Categories. It over came a lot of any system's inconvenience; Causing the belief that Cloud Computing Could actually Contribute in Consummating the Arab world with Cooperation of the Creditable Calibre and Cosmic Creative minds.

Cloud computing is a general term for anything that involves delivering hosted services over the Internet. These services are broadly divided into three categories: Infrastructure as a service (IaaS), Platform as a Service (PaaS) and Software as a Service (SaaS). In cloud computing computers would only work as terminals to these services only containing a –not as complex- operating system and a web browser, rather than relying on desktop or traditional servers. It has many benefits such as accessing data could be anytime at anywhere, improved reliability and security of data. Also there's a wider access to free software and software would be up-to-date with less malware. But how will cloud computing become an integral part of our lives in the Arab world? Now that's the real question.

Business wise, before cloud computing existed, traditional business applications have been very complicated and expensive, the amount and variety of hardware and software required were daunting, where a whole team of experts were needed to install, configure, test, run, secure and update them. This means that a lot of money would be spent and in return the work done would hardly be efficient. Giving the biggest companies with the best IT departments' inconvenience, while small and mid-sized businesses wouldn't even stand a chance. But, with cloud computing all that wouldn't be a problem any more.

Now let's introduce cloud computing to the Arab business world. If the biggest companies use cloud computing, a huge percentage of the company's income would be saved, as instead of spending it on all the software and hardware maintenance, the employee's salary may increase, also the company itself may improve its working environment which would lead to a better outcome. Yet, there would be less employment especially in the IT departments' which would arise a competing environment and for that the company would once again reach a better outcome.

While the expenses needed to open a small business would be a lot less, providing many job opportunities in better working environments, with better salaries than before.

In my opinion, the best feature cloud computing provides is how applications and personal data may be accessed from anywhere, solving two problems; the first is that an employee wouldn't really have to care about the technical part of any application also

any application needed would be found with reasonable prices, so that full concentration would be given only to the actual work and the next step to anything. The second problem would be if any kind of team work was occurring, exchanging data would be much easier, especially the heavy data, at least the words '**Forgot to Bring**' and '**Hard to Get**' would no longer be used.

Intellectual wise, Cloud computing is one of the most problem solving systems I have ever seen. Letting the Arab's acknowledge such technology would direct our brilliant minds towards a more innovating path, realizing the limitless extent our creativity may reach.

Political wise, We need a serious cloud service located in the Arab world to develop our own data centers to control our data and increase our independence; this must be in a free and strong state that wouldn't pose sanctions on data; Freedom without western dependence.

Sadly, Arabs (most of them) are considered third world countries and we actually are critical parts of global clouds. So it's proven that we can use the technology... So why sell it to the so called first world countries? Why not use it for us to create a league of our own? ...Think about it. =)
