Part 1 - Summary

Use this space to summarize your thoughts on the lesson

Part 2 - Responses

Slide 1	Your Response
	Answer 1: How populations meet their basic needs vary in many ways, here are three examples. First, populations meet their basic needs by finding fresh water, food, and breathing air. They need these things to help give them energy so they can move and do their basic needs. Second, fish and amphibians use the oxygen in the water and each other to survive. An example is Otter eat fish and other amphibians to survive. Finally, ecosystems help the animals to survive by them getting the living things or nonliving to survive. All in all, populations use their basic needs to survive in so many different ways.
