

Spelling/Grammar: I had to check my blogs for grammar and spelling errors. There were errors in the blogs that I didn't see before on my website. I mis-capitalized some words that were in my earlier blogs. also reworded certain sentence to make them look more grammatically correct.

Links: There were a few links on my portfolio that were leading to non-existent project webpages. I had to change a few href references in my <link> tags on my portfolio.

Navigation links: All my web pages had navigation links, so there was nothing to change here.

Look of Website: The look of my website is pretty consistent overall. Besides their content, all of my webpages look pretty much the same. I need to validate the html of my webpages though later.

Projects: I went in my portfolio to check if all my projects actually work. I only had to fix a couple of errors in the rendered and embedded version of the coin flip model. There was an unexpected \$end in both of my models. I fixed them both by putting a closing curly bracket in my rendered model and getting rid of the space in front of my HEREDOC for the embedded model. Other than that, there were no other errors for my other projects. I also need to validate the html for these projects as well.

Project Descriptions: I had to add some descriptions for the fall and spring projects because I didn't feel like I needed to do them until now.

Project Accessibility: All of my projects are accessible to anyone that wants to download or view them with a link.

Different web browsers: The website works pretty much the same in all of the browsers that I've used so far. The website also behaves the same in the browsers too.
