

An analysis for Stack Overflow Problem Solving Process.

Researched by: Mark Joseph Cadsawan

1. We need to add a button on the home page if a user wants to ask something or if they have a problem which they want to be resolved via Javul.

With this, I added functionality on my proposed Home page view

2. Before the user can provide the details of the question for the first time, the system should provide a reminder on how to effectively ask a question on the site

3. Also we can add a full but simple instruction on how to ask a question or a problem so that users can will have a reference everytime they add a question on Java.

Step 1: Draft your question

The community is here to help you with specific coding, algorithm, or language problems.

Avoid asking opinion-based questions.

1. Summarize the problem

- Include details about your goal
- Describe expected and actual results
- Include any error messages

2. Describe what you've tried

3. Show some code

4. Minimum fields required should be the title and the body as well as we can ask the users to tag their question/s in order for the system to appropriately handle the analytics and as well, effectively identify the question for the benefit of all users and admins.

Ask a public question

Title
Be specific and imagine you're asking a question to another person

e.g. Is there an R function for finding the index of an element in a vector?

Body
Include all the information someone would need to answer your question

B *I* [Hide formatting tips](#)

[Links](#) [Images](#) [Styling/Headers](#) [Lists](#) [Blockquotes](#) [Code](#) [HTML](#) [Tables](#) [More](#)

Links Images Styling/Headers Lists Blockquotes Code HTML Tables More

`code` **bold** *italic* >quote

Tags
Add up to 5 tags to describe what your question is about

e.g. (json css c)

[Review your question](#)

5. While typing the question title, the system can already suggest a similar question in case the question being asked has been asked before.

Only run tests if previous tests haven't failed
TL:DR; I have an list. You can: Add, Remove, Edit and Search/Filter items. I want to run my tests only if the first test it('shall delete a new item', ..) was successful. Is there a way I can do this?

androidx.test:orchestrator in test-only module ('com.android.test')
We are struggling to use the test orchestrator in our new test only module. We had it working fine when the tests were located in the app module. One observation is that when working within a test-only module, dependencies are brought in slightly differently. Test only

6. We can also control the corrected and accuracy of questions by putting validations such as
 - a. Character Length Validation (Recommended Minimum 30 characters)
 - b. Grammar Check
 - c. Quality Standards - Refer to Item #8

Body

Include all the information someone would need to answer your question

B *I*

Links Images Styling/Headers Lists Blockquotes Code HTML Tables More

Test only test only

Body must be at least 30 characters; you entered 19.

`code` **bold** *italic* >quote

7. An AI can also be implemented to guide the users. For example I am done with step 1, now the page is showing me step 2.

8. We can also implement a quality standard which will enforce correctness, accuracy and validation of all user entries on Javul. Less Garbage content more efficient and user friendly a system is. If a new content does not meet the quality standard, a link for the quality standard help page should be prompted to the user.

Why do I see a message that my question does not meet quality standards?

Sometimes users encounter the following message when posting a question:

"This post does not meet our quality standards."

If you see this message, then your question was automatically blocked by the server. All new questions are subjected to a "minimum quality" filter that checks for some basic indicators of a good, complete question. Check to make sure that your question has the following:

- A clear title.
- A reasonable explanation of what your question is. Add as much detail as you can.
- Any background research you've tried but wasn't enough to solve your problem.
- Correct use of English spelling and grammar to the best of your ability.

The [community-curated FAQ](#) contains more details.

For more information on how to ask a question well, please see our [How to Ask guide](#).

If you have all of these elements, your question is still blocked, and you feel this is in error, [click here to contact us](#).

Asking

- What types of questions should I avoid asking?
- What topics can I ask about here?
- What does it mean if a question is "closed"?
- Why are some questions marked as duplicate?
- What if I disagree with the closure of a question? How can I reopen it?
- Why are questions no longer being accepted from my account?
- How do I ask a good question?
- How to create a Minimal, Reproducible Example
- I've thought better of my question; can I delete it?
- Why and how are some questions deleted?
- What should I do if no one answers my question?
- What are tags, and how should I use them?
- Why is the system asking me to wait a day or more before asking another question?
- Why do I see a message that my question does not meet quality standards?**
- What should I do when someone answers my question?

- Once the user has successfully posted their question/problem. The system can inform the user on what are the next steps

10. This is the question/problem view in Stackoverflow

The screenshot shows a Stack Overflow question page. The title is "I would like to start learning PHP as developer". Below the title, it says "Asked today", "Active today", and "Viewed 1 time". The question text is: "I am familiar with PHP, I am using it previously maybe 10 years ago, I jumped into new technology platform such as Peoplesoft, Oracle Fusion and Workday. Now I plan to study more of PHP again as part of my plan to freelance my skills. Can you help me identify which PHP technology or tools should I prioritize and study?". There is a tag "visual-studio". Below the question, there are buttons for "Share", "Edit", "Delete", and "Flag". On the right, there is a user profile for "Marko Cadsawan" with a "New contributor" badge. At the bottom, there is a button "Answer Your Question" and a link to share the question via email, Twitter, or Facebook.

11. We can use the fields below such as

- Asked → this is a date field that contains the date when the problem was created
- Active → This is a date field that shows when did the authors last visited the problem
- Viewed → Shows how many people viewed the problem,

This screenshot is similar to the one above, but with red underlines under the text "Asked today", "Active today", and "Viewed 1 time" to highlight these fields.

12. We can use the fields below such as

- Upvote → We discussed this in our previous meetings. Notice that upvoting should happen if the problem shows clear and has a research or problem solving effort.

13. We can use the fields below such as

- Downvote → We discussed this in our previous meetings. Notice that downvoting should only happen if the problem does not require any problem solving effort or if it's unclear or not useful.

14. We can use the functionality below such as

a. **Bookmark**

- b. **Tags** → When hovered, the system can show initial analytics such as how many are watching the problems linked by the same tag and how many questions are linked to the same tag.

- c. **Activity** → Shows all the history/activity/**timeline** done for the problem.

Notice that users can also see voting history

- d. Users can also **Share** the problem to other social media platforms or there should be an option where users can copy the link itself so that they can share it to other platforms not integrated to the system.

- e. Edit -> Author can also edit their problem or questions.

- f. Authors can also **Delete** their published problems, notice that other users can also vote to delete it.

- g. Users can also report or **Flag** the problem if they think that is it inappropriate.

[Add a comment](#)

- h. The post can also be shared via popular social media platforms and email.

15. After 5 minutes after publishing the question, my post was closed by someone (M.Erikson). Notice that I can still edit the question or delete it. Also the M. Erikson provided a comment on why he closed my problem. Notice that I can also comment on it.

These types of questions are unfortunately off-topic here since they lead to opinionated and subjective answers better suited for discussions forums. This site is for when you have specific concrete issues that you need help solving. – [M. Eriksson](#) 1 min ago

16. If a user wants to reopen their problems they can do so, but there is a rule for reopening closed problems. Notice that the community of users are involved in the reopening process.

17. Here is the documentation for reopening a problem.

- a. Only users with 3,000 reputation are allowed to access the reopen queue.
- b. A problem or question will be included on the reopen queue if it gets at least one vote for reopening.
- c. On the image are the sample reasons why a problem was closed. For my example problem it was tagged as the last reason on the list.

How do I use the Reopen votes queue?

Access earned at 3,000 reputation

Any closed question that has **received one reopen vote gets added to this queue**, as well as any question with significant edits that address the close reason(s). Before reviewing in this queue, you should be familiar with what sorts of questions should and should not be closed. To find that information, see the following two pages:

- The Help Center article [What does it mean if a question is "closed"?](#) is a network-wide guide about the primary reasons questions should be closed. This generally happens when a question:
 - is a duplicate of an existing question on the site
 - needs additional details or clarity to be answered
 - needs to be more focused, as the existing question is too broad
 - **is an opinion-based question that doesn't have an objectively correct answer**
- The Help Center article [What topics can I ask about here?](#) is a site-specific guide to what types of questions are allowed and disallowed on this site. The contents of this page will differ on each site on the Stack Exchange network.

Basic workflow

Evaluate the question as it is now. Review any edits that may have been made after the question was closed and any comments on the question. If edits were made but are insufficient to reopen the question, consider leaving a comment explaining why.

- **Leave closed** if any close reason(s) still apply. Do not reopen if the specific reason for closure no longer applies but the question should still be closed. Consider leaving a comment to explain why the question

18. Here is the steps that the user should follow for reopening a closed problem.

Basic workflow

Evaluate the question as it is now. Review any edits that may have been made after the question was closed and any comments on the question. If edits were made but are insufficient to reopen the question, consider leaving a comment explaining why.

- **Leave closed** if any close reason(s) still apply. Do not reopen if the specific reason for closure no longer applies but the question should still be closed. Consider leaving a comment to explain why the question should remain closed, particularly if the reason is different than what appears in the banner.
- **Edit and reopen** if you can resolve issues with the question yourself, and these edits are sufficient for the post to be reopened. (Avoid making minor edits that don't impact whether the post should be reopened.)
- **Reopen** if issues with the question have been resolved, or if it was incorrectly closed.
- **Skip** if you're not sure whether the question should be reopened.

Tip: You may want to restrict which questions you see in this queue to subjects you are familiar with by filtering reviews by tags you have experience in. You can do this by clicking "Filter" in the top section of a review task. When in doubt, choose Skip.
