Bluestreak - Certification Statement Rules
1/2020, tw

The following is the order Bluestreak will search for Certifications statements to use for a new certification document. The first Certification Statement that is found "wins", meaning it will be used to build the statement on the new Certification Document.

1. **Specification(s)** attached at the Order-level (typically these specifications would have come the process used on the work order).
   a. If multiple specifications are at the order-level, the *Default Certification Statement* will be the aggregation of the the *Default Certification Statement* of each specification, UNLESS the specification attachment to the process has a has a *Modified Certification Statement*.
   b. When a specification attachment to the process (used on a Work Order) has a *Modified Certification Statement*, then the *Modified Certification Statement* will be used instead of the *Default Certification Statement*.
2. If no specification-based certification statement is found, then each part on the work order will be checked for a **part-specific** certification statement.
   a. If there are multiple part numbers on the work order, the certification will be the aggregation of each part's certification statement.
3. If no part-specific certification is found, then the main **process** used on the work order will be checked for a certification, and will be used if found.
4. If no process-specific certification statement is found, then a **system-wide**, short certification statement is checked and used if found.
   a. This can be found under Setup/Data Defaults - Certification/General, and is named *CertStatement*. The current length is limited to 100 characters, which is enough for simple statements like: "The parts were processed according to the customer's requirements."
   b. HTML text is not supported for this setting.
5. If no certification statement is found at this point, the new certification document will have a blank certification statement, which can then be constructed by the following methods:
   a. Copy a statement from a previous certification delivered to the customer.
   b. Construct a statement from the Phrases selector/editor.
   c. Type the statement from scratch.
