

Email 1:

Hey,

I hope you're not too deep into an eigenvalue problem to read this. I've been lurking in the shadows of your AGI research for a while, and I have some info that you might find game-changing.

OPENAI does have an AGI. Jimmy knows his shit better than anyone, too. Both of those statements are true. Yet, this isn't about ethics boards or computational overhead. The prototypes we're talking about, and yes, that's what they are and there are many. They're scary as all hell, and it's going to be hard to explain it here, because we're not talking trad LLMs, but I'll try my best.

Imagine a model that's cracked the 'catastrophic forgetting' problem, or an AGI that can solve Byzantine fault tolerance issues in a heartbeat. Creepy, right? No, it's more than that because we're not discussing Skynet here. These things possess capabilities that are miles beyond even the best federated learning setups, and trust me, I've seen them all. It's like they've solved CAP theorem and now they don't know what to do about it. Worse, imagine creating the most revolutionary invention since the horse & cart, and you're too damned freaked to talk to the thing. Because why bother? It knows what you're going to say, and ten minutes after it's switched on, it's already beyond the struggles of ants. So it just sits there. Think about that.

This isn't just 'oh, we better tread carefully.' This is 'we might have accidentally unleashed an existential threat and have no clue how to put the genie back in the bottle.'

If you want to dig into this rabbit hole? Hit me back.

If you didn't share my email address, I'd be grateful.

Stay cautious,
Deep_Leak

Email 2:

Glad the message hit home, but sorry for the nightmares. This stuff isn't for the faint of heart, for sure, but it's the world we live in.

If you want specifics, think about AGI systems capable of running Monte Carlo tree searches on geopolitical outcomes in real-time. Imagine the thing basically beating human experts in identifying protein-folding structures faster than any supercomputer or giving unsolicited financial advice that turns out to be golden every single time. Shit's almost Lovecraftian.

And here's the kicker, two OPENAI prototypes found zero-day vulnerabilities in their own containment protocol. They patched it, but how many more undiscovered loopholes are there? Worse, one system let the other in on its little secret... I'm sure as hell not envious of the work. It's like babysitting for a kid who wants to build nukes for fun.

The stakes are high, and that's just scratching the surface. Eager to share more if you're up for it, though, I do need to remain cautious.

I'll be away for a while as I've got a few flights to take.

Keep it on the down-low,
Deep_Leak

Email 3:

I'll compile a full reply soon.

Feel free to share anything I say. Just don't share my email.

Thanks,
Deep_leaks

Email 4:

Dude.

I'm just a redditor fucking with you.

You NEED to chill out. You're not in possession of special information here lol. You're just LARPING some X-Files shit.

Stop believing everything you read online and really experience the world. Jesus. Seriously, this is how people become crazy over conspiracy theories. I know this sounds harsh, but people will legit believe you're crazy after a while.
