

Abstract

Case presentation

Global health problem list:

- Fragmented care for patients with multiple comorbidities, effect on delays in diagnosis and interventions and risk to patients (specially in TB where we have different centers for patients that are separate from the larger hospital setting?)
- STEMI's NSTEMI's v/s OMI's (differentiating MI types effectively) and their implication on decisions for intervention, specifically in resource limited settings
- Importance of serial monitoring
(to be updated after call with patient and relatives)

Global health problem analysis

Conclusion
