

GET, POST, PUT,DELETE in express

Hana Aden documentation

Hey I am Hana Aden today I wanna guide you doing the 4 magic words of express

1: get : use that when you like to get/read something like data from the server side

2: put : is update existing data on the server side

3: delete : is the deleting the data on server side

4 : post : adding or creating data to you server side data like database

The first thing that I tried to understand is What is express ?

Express is Framework that handles HTTP request in simple way you can say it is a tool that helps make a server in node js

It is like helper that handles requests and responses between clients to servers

Since you understand that let we start

First I created a folder and I named it express CRUD after that I created a file inside that folder and I named it [server.js](#)

I started coding immediately the first line `const express = require("express")` what happened was Vs code saying wait "who is express" then I figured out that I should install express in my folder

Better for you to do so now write this command as I did

In my terminal :

```
PS D:\Hana\online study\visual st\Express crud>npm init -y
```

```
PS D:\Hana\online study\visual st\Express crud>npm install express
```

See now you see the magic you got the package json in your Folder as do I after that VS code recognized the express

Now I have express installed package json installed and my first line of code

```
const express = require("express")
```

Now I added

`Const app = express( )` that means I created express app ahead the third line is `app.use(express.json( ))` means any time that some sends a JSON data to the server side please change it into javascript object so I can send responses and use it as `req.body` without this line the `req.body` will stay undefined

Now we have our first 3 lines

```
Const express = require("express")
```

```
Const app = express( )  
app.use(express.json( ))
```

Let we go ahead what we are waiting we need a data so let we create a fake database by our selves

```
Let users = [  
{id : 1 , name : "John"},  
{id :2 , name : "Jane"}  
]
```

As Basic javaScript the word [LET] allowing as the changes means if we make const the PUT in express is impossible as well as POST and what we have is array inside it a objects so that is our database by now

Now let we start the four words but before that we need to know or check if our server is running

So start the server

```
app.listen(5000, ( ) => console.log("the server is running on port 5000") )
```

Let we prepare the postman

The postman is tool helps us to test our APIs you can directly send requests to you server side instead of building the frontend everytime

Click new in your post man and paste the URL "<http://localhost:5000/users>"

Before pasting like we do the get in our server side

Now above you app.listen(5000, () => console.log("the server is running on port 5000"))

Create your POST GET PUT DELETE things

Let we fo the GET then code with me :

```
app.get("/users" , (req ,res)=>{  
  res.json(users)  
}
```

Now you wonder what is req , res and "/users" the "/users" is route path that you add you api see "<http://localhost:5000/users>" now req(request) is all incoming information about the request the client made example [req.body.name](#) you will get name and res(response) means is what you send to the client side

It get method see you send all users in your database to the client side that is why you used res

No in your terminal :

PS D:\Hana\online study\visual st\Express crud> node [server.js](#)

You have to get
the server is running on port 5000

Ok let we go the postman paste this URL "<http://localhost:5000/users>" choose get and click send

So you will get in your postman this

One my first mistake the postman was giving we error saying not found while now is giving me response look I figured our running the server always will gonna solve the problem

Now let me go to the POST

```
app.post("/users" , (req ,res )=>{  
  Const newUser = {  
    id : users.length + 1 ,  
    name : req.body.name  
  }  
  users.push(newUser)  
  res.status(201).json(newUser)  
})
```

EXPLANATION

[app.post](#) : creates POST route in express

“/users” : this is URL path as you know so when someone sends request to <http://localhost:5000/users> this code will run
Users.length + 1 : automatically gives id
[req.body.name](#) : read the name requested in the body
And pushes into your user

Now go to your postman in this URL <http://localhost:5000/users> choose POST then body -> raw then JSON

Choose body then raw then JSON
And write

Click send
Now you see in your postman

Why we are not going back to get and see if our database is updated

```

1  [
2    {
3      "id": 1,
4      "name": "Jane"
5    },
6    {
7      "id": 2,
8      "name": "John"
9    },
10   {
11     "id": 3,
12     "name": "Leo"

```

See now I added a user

Let we go to PUT

As usual do but in our route we add ID so we have to get the user id that we are updating

```

app.post("/users/:id" , (req ,res)=>{
  Const userId = parseInt(req.params.id)
  Const user = users.find(u=>u.id === userId)
  if(!user ) return res.status(404).json({messege: "user not found"})
  user.name = req.body.name
  res.json(user)
}

```

Now in your postman copy the link <http://localhost:5000/users/2>

Choose PUT => Body => raw => json

You will get in your post man

{} JSON ▾ ▶ Preview  Visualize ▾

```

1  {
2    "id": 2,
3    "name": "Johnny"
4  }

```

Now check again the get and see the update

```

[
  {
    "id": 1,
    "name": "Jane"
  },
  {
    "id": 2,
    "name": "Johnny"
  },
  {
    "id": 3,
    "name": "Leo"
  }
]

```

Now let we do the DELETE the only one that is remaining

```

app.delete("/users/:id"){
  Const userId = parseInt(req.params.id)
  Const userIndex = users.findIndex(u=>u.id === userId)
  if (user.id === -1) return res.status(404).json({messege: "user not found"})
  users.splice(userIndex , 1)
  res.json({messege : "user deleted successfully"})
}

```

Now our postman

DELETE

▼

http://localhost:5000/users/2

Send

▼

The output

{}

JSON

▼

▶ Preview

🖼 Visualize

▼

```
1  {}
2  |  "message": "user deleted successfully"
3  |  }
```

Let we get our users

{}

JSON

▼

▶ Preview

🖼 Visualize

▼

```
1  [
2  |  {
3  |    "id": 1,
4  |    "name": "Jane"
5  |  },
6  |  {
7  |    "id": 3,
8  |    "name": "Leo"
9  |  }
10 ]
```

Hope this documentation helped as intended

FULL CODE

```
const express = require("express")
const app = express()
app.use(express.json())

let users = [
  {id: 1 , name : "Jane"},
  {id: 2 , name : "John"}
]

app.get("/users" , (req ,res)=>{
  res.json(users)
})

app.post("/users" , (req ,res)=>{
  const newUser = {
    id : users.length + 1 ,
    name : req.body.name
  }
  users.push(newUser)
  res.status(201).json(newUser)
})

app.put("/users:id" , (req ,res)=>{
  const userId = parseInt(req.params.id)
  const user = users.find(u=>u.id === userId)
  if(!user){
    return res.status(404).json({messege : "user not found"})
  }
  user.name = req.body.name
  res.json(user)
})

app.delete("/users/:id" , (req ,res)=>{
  const userId = parseInt(req.params.id)
  const userIndex = users.findIndex(u => u.id === userId)
  if(userId === -1){
```

```
        return res.status(303).json({message : "user not found"})

    }

    users.splice(userIndex , 1)
    res.json({message : "deleted successfully"})
  })
  app.listen(5000, ()=> console.log("server is running on port 5000"))
```
