Feedback:

- TokenMint Block Explorer: Very easy to use for Beginnes to access could be more information about what each part doing like Input box and output Boxes when you highlight could tell you a bit more information. Nice to see everything in one place and easy to read the information and only clicks aways to different options.

- TokenMint Token Generator:

Very easy to use on the website could put the Create token and Mint the Token together in the option and then you don't have to make two transactions but over all very easy to understand and connect the cobalt wallet to Maint token to your wallet.

- Cobalt: Very easy to use and very clean feel to the app Did not take long to send the token to the wallet be nice if we can add multiple accounts to the wallet easy to get around and recovery the wallet too. When sending the tokens you could make it go back to the home screen after you send the token.

- Sphere by Horizen Testnet:

Love the design easy to access send and receive options > Was very easy to send tokens to the cobalt sidechain to make transactions. Love how you can set up batch options too.Everything you need was two to three clicks away. Love how easy it was to access view on blockchain
