Using the data from systems to get information to identify opportunities for improvement and using technology to reduce times and costs are needs that every company has. Ever since I learned these subjects at the university classes of the System Engineering Faculty, I found it fascinating. I also have had the opportunity to be part of different technology projects at work and deal with data, information, and systems at different levels to which I felt very comfortable working with. Given the fact that companies always want to be better, and technologies are always improving, I consider that a master in Management Sciences will enhance my knowledge and give me the methodological tools to lead projects related to technology and systems.

During my years at the University of X, where I ended up being the valedictorian of my graduating class, I learned the importance of planning a project with the right methodologies, how to be part of a team, and how to focus on the results and how to get them. When I first started to work, these skills helped me to understand what my boss wanted from me when working on projects.
Since then, I have continued to develop skills that helped me think quickly for possible solutions and execute them in the event of an inconvenience, so they are dealt with in the right way. Also, how to give information and explain it to different audiences even if they are not tech savvy so everyone involved understands your needs, your objectives, and their role to accomplish them.

Therefore, I am interested in studying a master's degree in Management Sciences to be able to continue growing professionally and to be able to focus on leading larger technology projects that I have had the opportunity to be part of. With the ability to generate a positive change in a company based on the improvement opportunities that are planned to be realized thanks to the technologies to be applied.

I believe that the University of Y, being one of Canada's leading universities, will allow me to receive an education alongside a diversity of professionals with whom I can broaden my knowledge and my professional and personal skills by

having different approaches based on different backgrounds to solve a problem and with the guidance of renowned faculty members who can help me achieve my goals.
