2. Do while loop :

it is also used for repeating the given statements until the condition is true. but it is also known as exit control loop. Because it checks the condition at the exit. Because of this nature, if the condition is false at the first time, then even the loop will run for one time.

`do/while` loop is a variant of the `while` loop. This loop will execute the code block once, before checking if the condition is true, then it will repeat the loop as long as the condition is true.

Syntax: -

```
do
{
        Instructions
        Inc/dec
} while(condition);
```
