

Bio-Diesel Subaru Sponsorship Proposal

_____I am building a vehicle to be driven on the street for less than \$20,000 that exceeds all current vehicle standards. The catch is that i'm going to build a used car, re-power it with a newer more efficient engine that i can run on bio-diesel, then update the rest of the car to be as smooth, capable and fun to drive as any current performance car someone might pick-up from the dealer.

I am going test this vehicle against today's performance cars, looking at vehicles like the Subaru Impreza STi, the Mitsubishi Evolution and the Camaros, Chargers and Mustangs that are coming out as well. I'm going to test all the performance aspects as well as the efficiency aspects. I not only want to make this vehicle more fun, faster, out-perform in all aspects, all while running bio-diesel in a 15 year old car.

Bio-fuels, sustainable fuels should be in all vehicles today. There is too much logic, the resources are already here, the cars are already set up for it, the effort involved in the change would be minimal and the savings in time, money, and freedom. You can't put a price on independence. This country is founded on it and we should really look at what powers affect our freedom and independence..

With this Subaru, i'm going to set records, create new technologies, inspire the next generations to be creative in coming up with options to deal with our world's problems. Be creative and be pro-active, go out there and do something. complaining isn't getting anyone anywhere at all.
