

Hi STK people,

On the background is some development for Stakecoin.

My intention is to transform Stakecoin to a security token linked with assets in the real world. These assets, eg Solar fields create a predictable cash flow and the holders of Stakecoin are then stakeholders in these assets. The community wallet with 750k STK is meant to be for an Initial Exchange Offering (IEO) to raise funds for investment into the eg Solar fields. We have an exchange partner that supports this plan and we thought that we had Solar fields business partners. It is a bit disappointing that the intended business partner walked away after we presented this awesome business case for Stakecoin.

Now we have serious contact with the Hybrix team and they offered to help us to integrate Stakecoin into their ecosystem. A possible future idea is to make a node available on a RaspberryPI that makes it possible to integrate simple smart contracts on the Stakecoin blockchain. Then it is possible to make an application that measures and predicts the power consumption and supply of Solar panels and makes the decision on financial and/or environmental parameters to store energy or sell on the market and Stakecoin can be the security token for value transfer. This is just one of the 1001 idea's that is possible with Stakecoin.
