PARAMETERS

image.file;image.file

image.mimeType;image.mimeType

This building block is for removing colors from a JPEG or PNG image and create a grayscale image.

Use cases

- Reducing memory usage of an image with adding compression artifacts (like in the Compress block)
- Preparing an image for use in black/white only processing, like printing.

Configuration

Clicking on **given file** in the title of the building block lets you pick the desired image from your Google Drive to be signed.

You can deselect the picked image by clicking on the $\times$ button on the right of the selected filename.

If no image has been picked, Ultradox will load the given image that is stored in the input variable.

When loading files stored in a variable, make sure that the input prefix matches the output prefix of the building block that provides the document.
