

Continuing saga of organizing elements

1. How does reactivity change for the nonmetals?
2. Which element is less reactive
 - a. F or C
 - b. Si or C
 - c. P or O
 - d. I or F
3. Why is family eight not included in the reactivity trends
4. When Fe combines with O will it make an acidic, base, or neutral solution?
5. When F combines with O will it make an acidic, base, or neutral solution?
6. What kind of solution will the metalloids make?
7. Explain what electronegativity is?
8. Where are valence electrons located at in the atom?
