Facilities proposal

2018-01-17

Agenda

- Facilities
 - General requirements
 - Proposal for revising standards
 - Active Places and opportunity data
- AOB
- Next Calls

Facilities: General requirements

General requirements

- Two broad categories of user need identified so far
- **Active Places:**
 - data that describes places where people can take part in activities
- **Facility availability:**
 - data that describes availability of facilities
 - “I want to book a squash court”

Facility Availability use cases

- What facilities are available at a location?
- What activities can be carried out in this facility?
- How do I find this specific squash court?
- What dates and times can I book this squash court?
- Is this squash court still available at a given time?

Facility requirements

1. Publish data about Facilities in an RDPE feed
2. Describe a Facility
 - associate a Facility with a Place
 - associate a Facility with activities
 - associate Events (slots) with Facilities
 - individual, or schedule
 - *describe availability of an Event (slot)*
3. Efficiently check if an Event is still available

Publish data about Facilities in a feed

- Identify what type of data an RDPE Feed includes

```
{  
  "feedObject": "http://schema.org/Event",  
  "rdpeVersion": "1.1",  
  "opportunityModelVersion": "1.1",  
  "items": "",  
  "next": "...",  
  "license": "..."  
}
```

Describe a Facility

- Define a new type, called Facility
 - Identify some useful sub-types, e.g. Squash Court to support filtering
- Use existing opportunity data model terms to:
 - associate the facility with a Place
 - associate the facility with one or more Events
 - associate the facility with one or more activities

Describe a Facility (Basic information)

```
{  
  "name": "Squash Court",  
  "type": "Facility",  
  "additionalType": "oa:SquashCourt", #based this on ActivePlaces, see later  
  "containedInPlace": {  
    "name": "Leisure Centre"  
  },  
  "activities": "squash"  
}
```

Describe a Facility (Events, Offers)

```
{  
  "name": "Squash Court",  
  "type": "Facility",  
  "event": [ {  
    "startDate": "...",  
    "endDate": "...",  
    "offers": [ ... ] #can include date-time when booking starts  
    "eventStatus": "http://openactive.io/ns#Available", #or Unavailable, indicates if booked  
  }  
}
```

Efficiently check if an Event is still available

- Data can be re-harvested, but likely to be slow
- Proposal:
 - define a new endpoint to allow checking availability of any Event included in an RDPE feed
 - supports real-time check and confirmation
 - use URI Templates to specify URLs for scheduled events

Comments?

- Any early thoughts on proposal?
- This doesn't address use cases such as:
 - Describing that a sports hall can be hired out by itself, or as separate courts
 - Platforms would hide this functionality

Active Places

Active Places

- Sport facilities database provided by Sport England
- <https://www.activeplacespower.com>

How is the data published?

- Data is available via an [API](#), and by downloading CSV/JSON files directly from the site's [download](#) page.
- The API endpoint declares that it conforms to the Openactive Realtime Paged Data Exchange 0.2.3 specification. (Note that this is slightly behind the current 1.0 release)
- The downloadable JSON is not paged, but follows the same structure as the JSON returned from the API

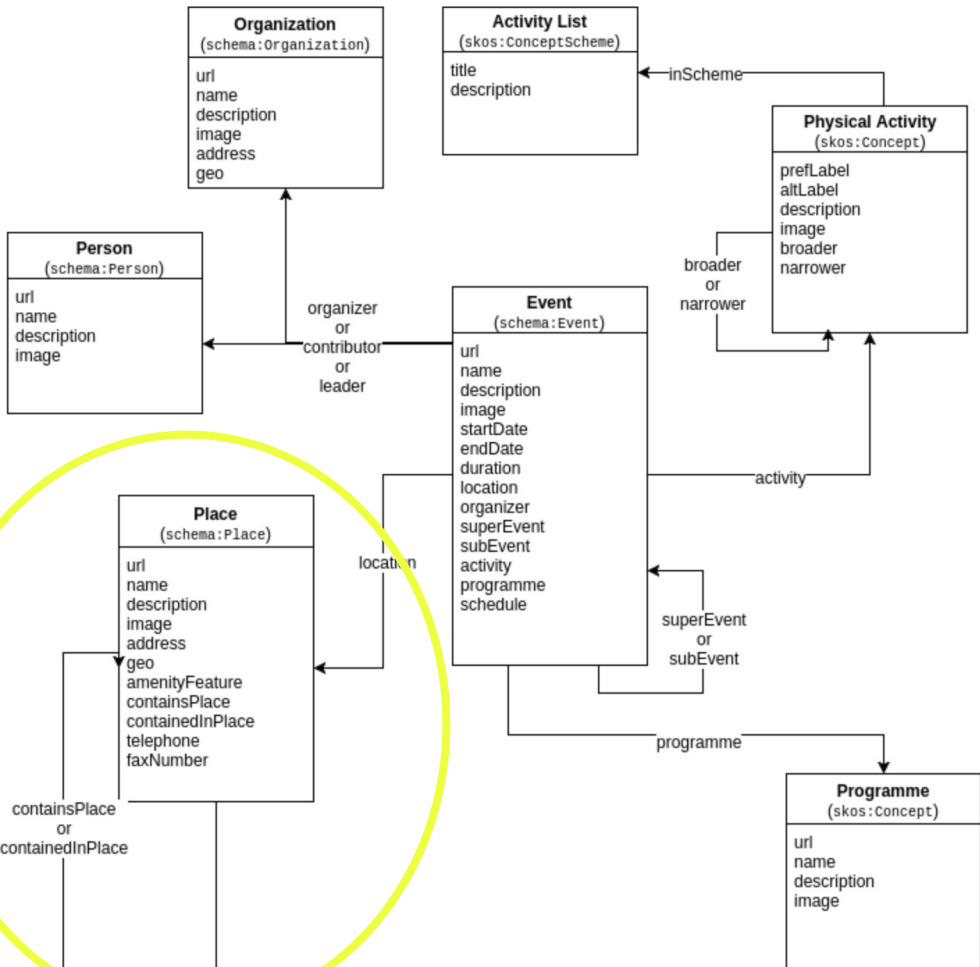

What form does the documentation/licence take?

There is nothing that clearly describes itself as documentation. Additional information is split across the following:

- FAQs: <https://www.activeplacespower.com/faqs/by/AllFAQs> (doesn't mention API)
- For the API, there is an interactive query tool:
https://www.activeplacespower.com/OpenData/Api/Docs#!/Sites/Sites_Get
- Licence is linked to in the API data:
<https://www.activeplacespower.com/Content/ActivePlacesOpenDataLicence.pdf>
- Data model schema: <https://www.activeplacespower.com/sdm>

Can Active Places locations be described using the opportunity data model?

- **Partly, but at a lower level of detail.** Active Places is currently capturing a lot more data (although not all of it is relevant to our needs) - see next slides.
- As noted, currently RDPE feeds largely focus on Events, not Places

Opportunity data schema diagram

How Active Places structures their site data returned by their API

It contains a lot more data than we capture about locations at the moment

Active Places - equipment and facility types

The following Google Sheet contains the Active Places...

- **Equipment types** (and number of each featured across all sites)
- **Facility types**
- **Facility sub-types** (have not included the relationship to facility types)

<https://docs.google.com/spreadsheets/d/16FQMSeKle54arw4KvRt1p8YLoRiKMuLWubkWEfNqPYU/edit?usp=sharing>

Example of facility data

Similarities

- Both have **names** and **descriptions** as part of the core model (although description does not seem to be surfaced via the API).
- Both have information around **facilities within a site** (but implemented differently).
- **Geo coordinates** are available from both the OA model and AP API (but modelled differently)
- **Address** information is available from both (but modelled differently).
- **Contact details** for a location are available from both (via AP:Contacts).

Differences

- How **addresses** are handled (including a lot of other categorisations AP-side)
- **OA model requires a url**, and suggests an image for a location.
- containedInPlace/containsPlace vs the **relationship between Sites and Facilities**.
- We are tracking **accessibility/disability** information at event level rather than for the venue.
- **Opening times** for (AP)Facilities, could cause some confusion with (OA)Event times for facilities that are generally open vs things that need to be booked/activities that happen within open periods.
- **Clubs** goes wider in scope than we have been looking at.

How could Active Places locations be referenced from opportunity data?

- Active Places Sites are identified using a numeric identifier
 - e.g. 1044065 for Padbury Village Hall
- Facilities within sites are also referenced by a numeric ID
 - e.g. within 1044065 there is a sports hall with ID 4111493
- Places in opportunity data could cross-reference Active Places dataset
 - Would allow data users to join that data to richer information available in Active Places

How could Active Places locations be referenced from opportunity data?

```
{  
  "type": "Place",  
  "name": "Padbury Village Hall",  
  "activePlacesId": "1044065"  
}
```

```
{  
  "type": "Place",  
  "name": "Padbury Village Hall",  
  "identifier": {  
    "propertyID": "oa:activePlacesId",  
    "value": "1044065"  
  }  
}
```

Active Places Proposal

- Don't try to fully align data models at this stage
- Use Active Places data model to inform our work on facilities
- **Recommend use of Active Places data** by data users
 - E.g. to drive specific discovery use cases, or to enrich existing datasets
- **Revise the specification and primer to describe how it can be used**
- Work with Sport England to see if there is useful ways to improve documentation and guidance
- Put additional Club information onto our roadmap
