

Introduction to Dynamic Programming Approach Using DP to solve the Fibonacci Numbers Problem

Week-08, Lesson-01 (part 1)

**Introduction & Fibonacci
Numbers**

Dynamic Programming

- An algorithm design technique (like divide and conquer)
- Divide and conquer
 - Partition the problem into independent subproblems
 - Solve the subproblems recursively
 - Combine the solutions to solve the original problem

DP - Two key ingredients

- Two key ingredients for an optimization problem to be suitable for a dynamic-programming solution:

1. optimal substructures

Each substructure is optimal.

(Principle of optimality)

2. overlapping subproblems

Subproblems are dependent.

(otherwise, a divide-and-conquer approach is the choice.)

Three basic components

- The development of a dynamic-programming algorithm has three basic components:
 - The recurrence relation (for defining the value of an optimal solution);
 - The tabular computation (for computing the value of an optimal solution);
 - The traceback (for delivering an optimal solution).

Fibonacci numbers

The *Fibonacci numbers* are defined by the following recurrence:

$$F_0 = 0$$

$$F_1 = 1$$

$$F_i = F_{i-1} + F_{i-2} \quad \text{for } i > 1.$$

How to compute F_{10} ?

Dynamic Programming

- Applicable when subproblems are not independent

- Subproblems share subsubproblems

E.g.: Fibonacci numbers:

- Recurrence: $F(n) = F(n-1) + F(n-2)$
- Boundary conditions: $F(1) = 0, F(2) = 1$
- Compute: $F(5) = 3, F(3) = 1, F(4) = 2$
- A divide and conquer approach would repeatedly solve the common subproblems
- Dynamic programming solves every subproblem just once and stores the answer in a table

Tabular computation

- The tabular computation can avoid recomputation.

F_0	F_1	F_2	F_3	F_4	F_5	F_6	F_7	F_8	F_9	F_{10}
0	1	1	2	3	5	8	13	21	34	55

Result

Dynamic Programming Algorithm

1. Characterize the structure of an optimal solution
2. Recursively define the value of an optimal solution
3. Compute the value of an optimal solution in a bottom-up fashion
4. Construct an optimal solution from computed information
