Cuando se bloquea el folículo pilosebáceo, impide que salga al exterior el contenido de las glándulas apocrinas.

Este fenómeno da lugar a la formación de quistes que suelen infectarse por las propias bacterias presentes en la piel [4].

En ocasiones, la presencia de manifestaciones inflamatorias drenantes de la HS podría llevarnos a pensar que es infecciosa [5].

El retraso en el diagnóstico de la hidradenitis supurativa conlleva el empeoramiento tanto a nivel físico como a nivel psicológico del paciente [6,7].

También se ha relacionado con un mayor riesgo de desarrollar enfermedad cardiovascular y con una reducción en la esperanza de vida [8,9].

When the pilosebaceous follicle is blocked, it prevents the contents of the apocrine glands from going to the outside.

This phenomenon gives rise to the formation of cysts that are usually infected by the bacteria present on the skin [4].

On occasions, the presence of draining inflammatory manifestations of HS could lead us to think that it is infectious [5].

The delay in the diagnosis of hidradenitis suppurativa leads to worsening both physically and psychologically in the patient [6,7].

It has also been linked to an increased risk of developing cardiovascular disease and a reduction in life expectancy [8,9].

2. Writefull Full Edit

When the pilosebaceous follicle is blocked, it prevents the contents of the apocrine glands from reaching the outside.

This phenomenon causes the formation of cysts that are usually infected by bacteria bacteria present on the skin [4].

In some cases, the presence of draining inflammatory manifestations of HS could lead us to think that it is infectious [5].

The delay in the diagnosis of hidradenitis suppurativa leads to a worsening of both physical and psychological symptoms in the patient [6,7].

It has also been associated with an increased risk of developing cardiovascular disease and a decrease in life expectancy [8,9].

Writefull doesn't only correct texts; it also helps the writing process
