# CoDebt

Team\_37\_my\_debtors

### PROJECT SUMMARY

CoDebt is a web application that enables schools within a specified location view, interact and verify outstanding school fees debt information about potential/present/past students. This application seeks to solve the problem of students absconding or accruing debt and switching schools without offsetting outstanding fees.

CoDebt will give school admins that are authenticated users (users that pass all set requirements for authentication including but not limited to providing verifiable identification documents) the access to upload, retrieve, update, and delete a debtor profile.

Interactions between the school administration and other users/ parties will be implemented by the means of a comment box.

The guardians/parents of the student debtors are only allowed to view the database and will be given the opportunity to contend debt profiles where a case of contention arises. Contention of debt will first be initialised via a registration/sign up on CoDebt.

# Product Design

## IDEA FOR PRODUCT DESIGN

To the best of our knowledge, the platform will assist schools in recovery their debts and curb/stop the trend of debtors leaving to other schools with their debt unpaid.

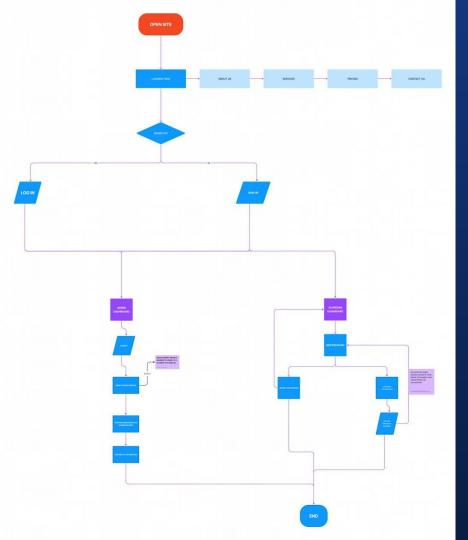

We started with our Design process which we carried out in the following:-

- Empathize ( User research, User interview)
- -Define (User persona, Empathy map)
- -Ideate (User flow, brainstorming, idea prioritization)
- -Prototype (sketching wireframe, Low Fi, High Fi)

Access <u>Team 37\_my\_debtors</u> for more information on our research plan.

## **USER FLOW**

Here we mapped out how users effectively move throughout the website (what actions will user's take on the website, what decision will user's make, and what screen will user's experience after taking an action or making a particular decision)

As such, the goal of our user flow is to map out how users achieve a specific goal as they move through the product.

Access <u>Team 37\_my\_debtors</u> for more information about our design process.

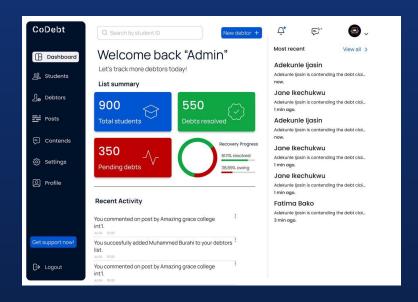

# LANDING PAGE

Here just as the features of our project, it consisted of basic information about the platform that depicts what the website is basically all about/documentation that unauthenticated user can view and interact with. Although there's no access to Data.

Access <u>Team 37\_my\_debtors</u> to view our style guide and other design screens.

### **ADMIN DASHBOARD**

The school administration can view list of their debtors and students on the dashboard. There, they can access information about status of their payment recovery progress. When a student contend for a debt claim, they're notified and have the opportunity to reply such claim. They also get notifications of their recent activity.

## Frontend Team

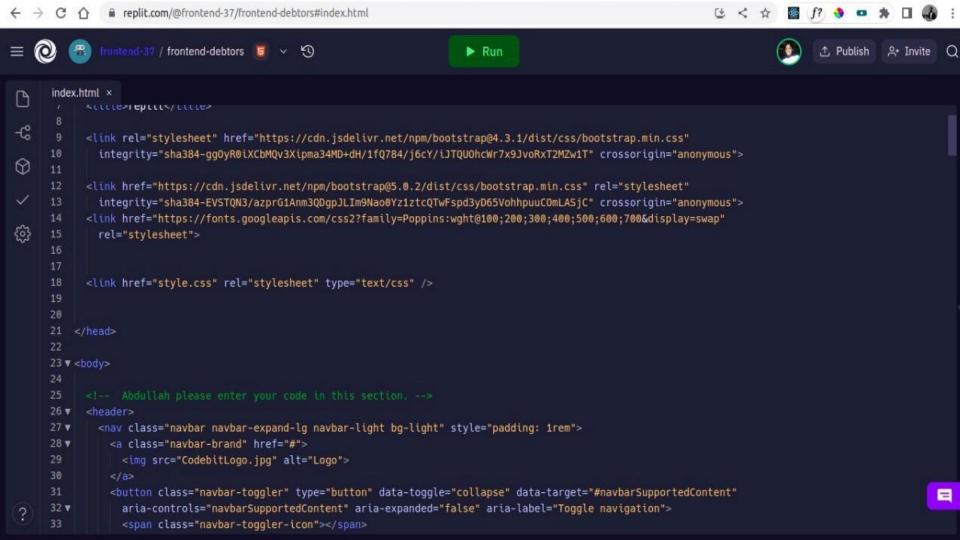

### IDEA FROM FRONTEND TEAM

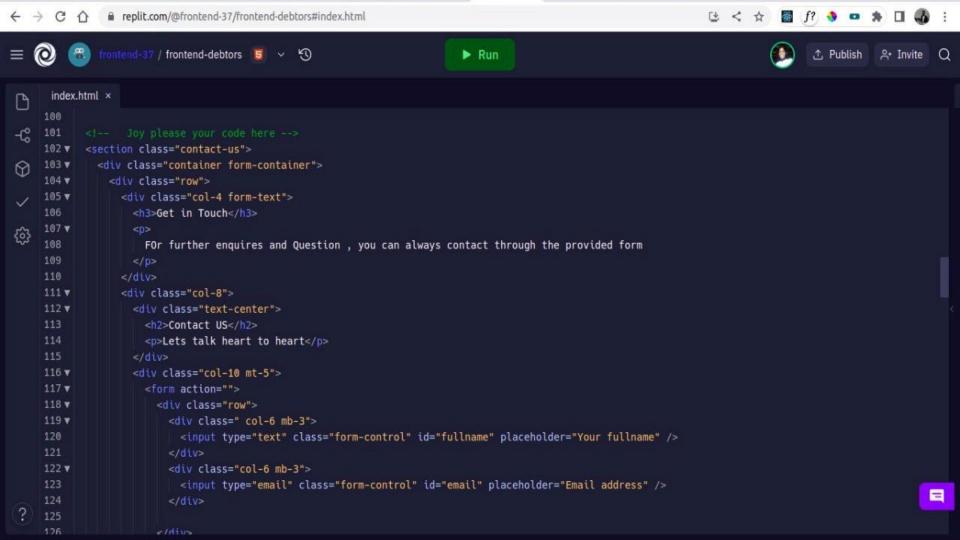

We have been collaborating and sharing codes via GitHub and replit.

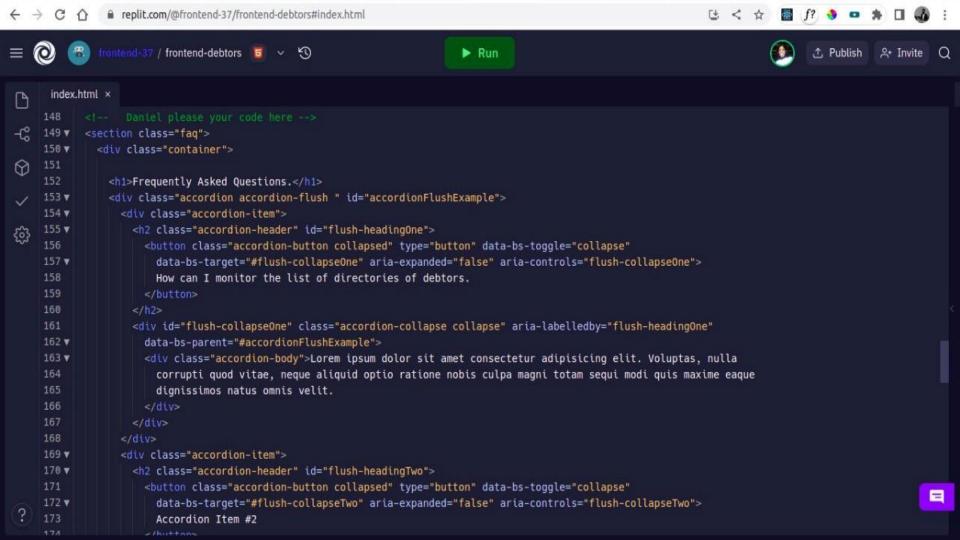

We broke down the page available into different sections and assigned each section to someone in the team which was delivered.

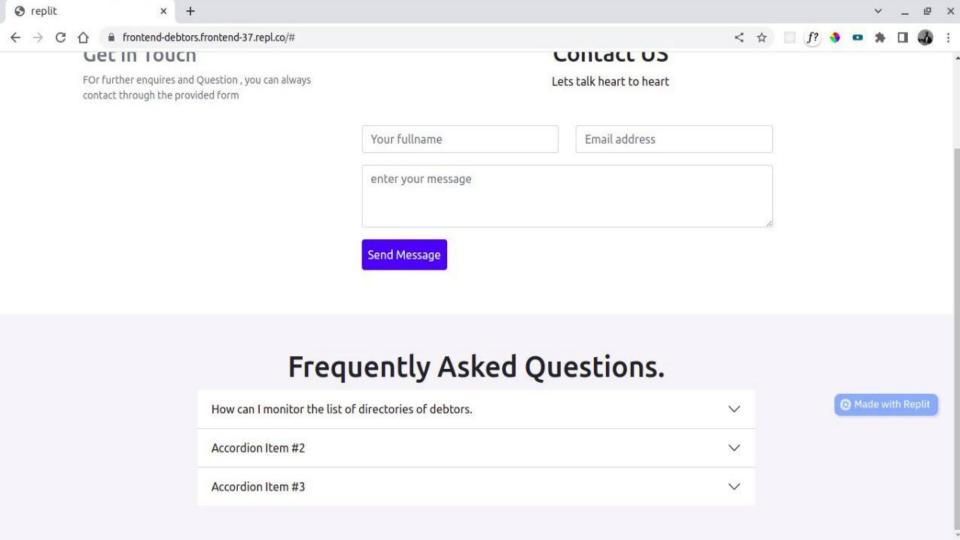

We are implementing both the vanilla and the bootstrap library for our project.

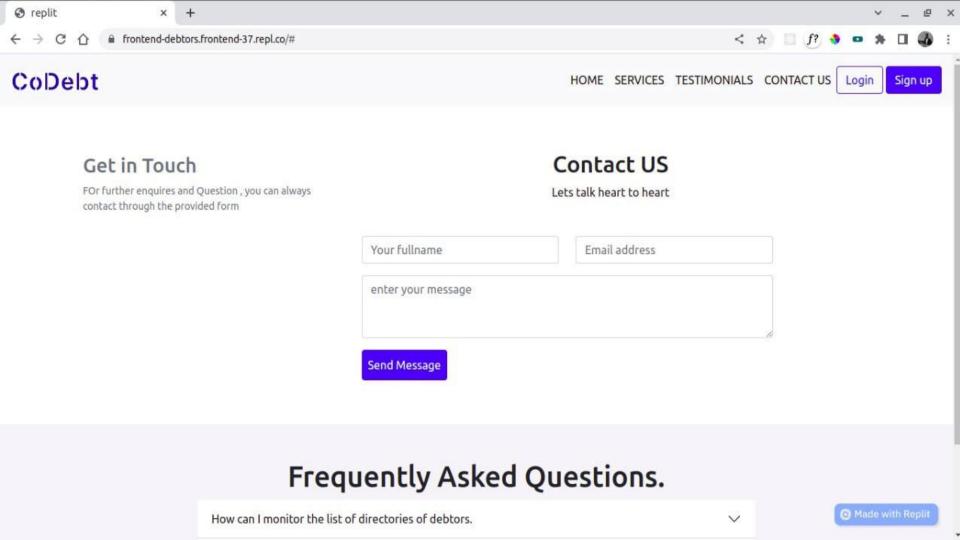

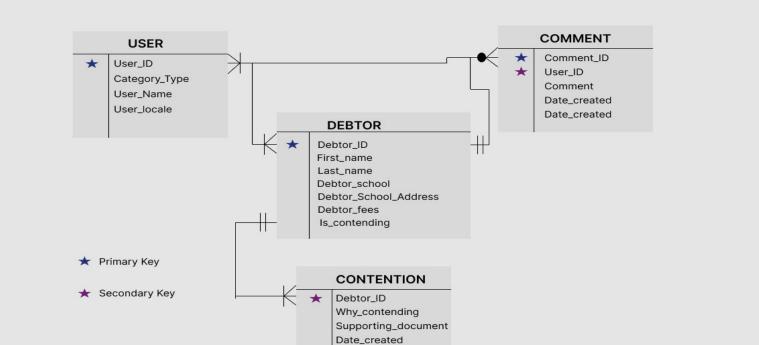

# Backend

#### The Functionalities that would be implemented in the development of the app are:

01

#### **Searching Debtors**

This should query the database and filter our students and display the ones who are owing. It should also have an option to search users who are contending (different from debtors)

02

#### Login/Logout

This should be a form to accept login by email and password, it should then do server side validation to see if those details are correct in our db and login the user. The client side validation will be done by the FE team so you don't have to worry about it. Upon successful login, the user should be redirected to the home page. Logout is less tedious since there's no validation. That's why I put them together as one task

03

#### **New User Registration**

This will accept various user data and check the validity, if information entered is valid, the new information is stored in the database. Should also be redirected to the homepage after successful login

#### The Functionalities that would be implemented in the development of the app are:

04

#### **Commenting**

This is where users are able to comment under the posts by admins. It should be sorted by most recent comments.

05

#### **Edit/Deleting debtors**

This is a functionality available only to school admins. If the user has successfully cleared his debt or paid it in part. The admin can edit/delete his post.

06

#### Creating a new debtor post

This will enable school admins create a new post if a new debtor wan japa.
Then publish the name on the site.
