

$\frac{1}{4}$

$\frac{3}{8}$

$\frac{1}{16}$

Adding with Unlike Denominators

Taking what we already know and
using it to help us solve something
new!

Deb Hill: LFES

Adding Fractions

- **Don't forget to update your Table of Contents**
- **On your new page write the following problems if you have not already done so.**

Adding Fractions with Unlike Denominators

1. $\frac{1}{16} + \frac{1}{4} =$ _____

2. $\frac{1}{8} + \frac{1}{4} =$ _____

3. $\frac{1}{8} + \frac{1}{16} =$ _____

**You already know
the answers**

Let's think back to...

Gallon Man !

Remember?

GALLON

QUART

PINT

CUP

**Here is the way
they “stack-up.”**

1 Gallon

1 Gallon

1 Gallon = 4 quarts

1 Gallon = 8 pints

1 Gallon = 16 cups

1 Quart

1 Quart = 2 pints

1 Quart = 4 cups

1 Pint

1 Pint = 2 cups

Remember how we built “Gallon Man?”

1 GALLON

“Gallon Man” and quarts

One Gallon = Four Quarts

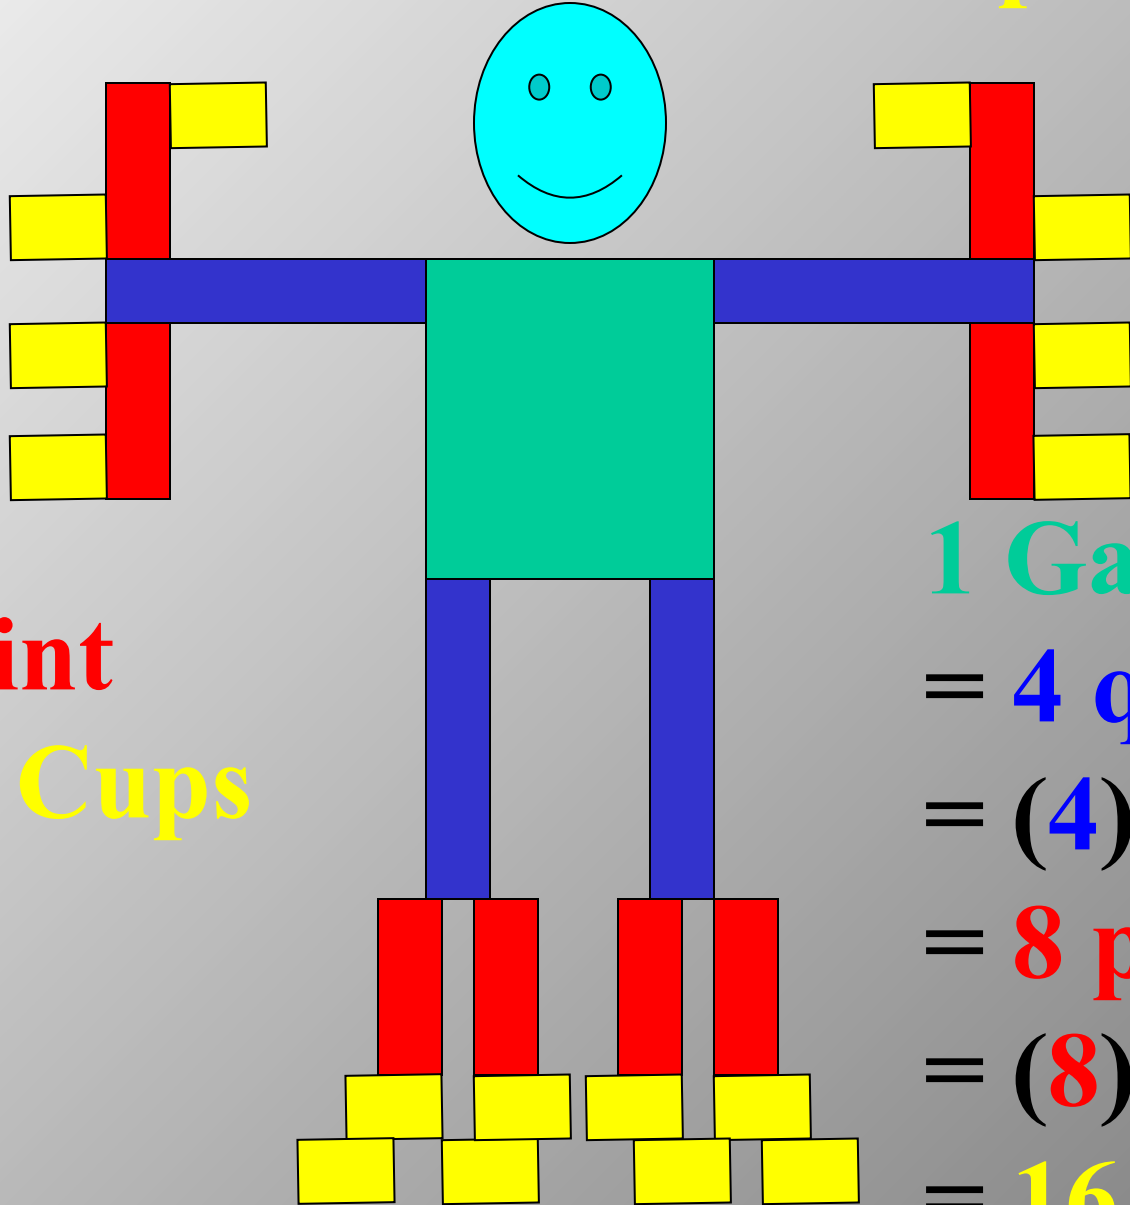

“Gallon Man” and pints

1 Quart
= 2 Pints

1 Gallon = 4 quarts = (4) (2) = 8 pints

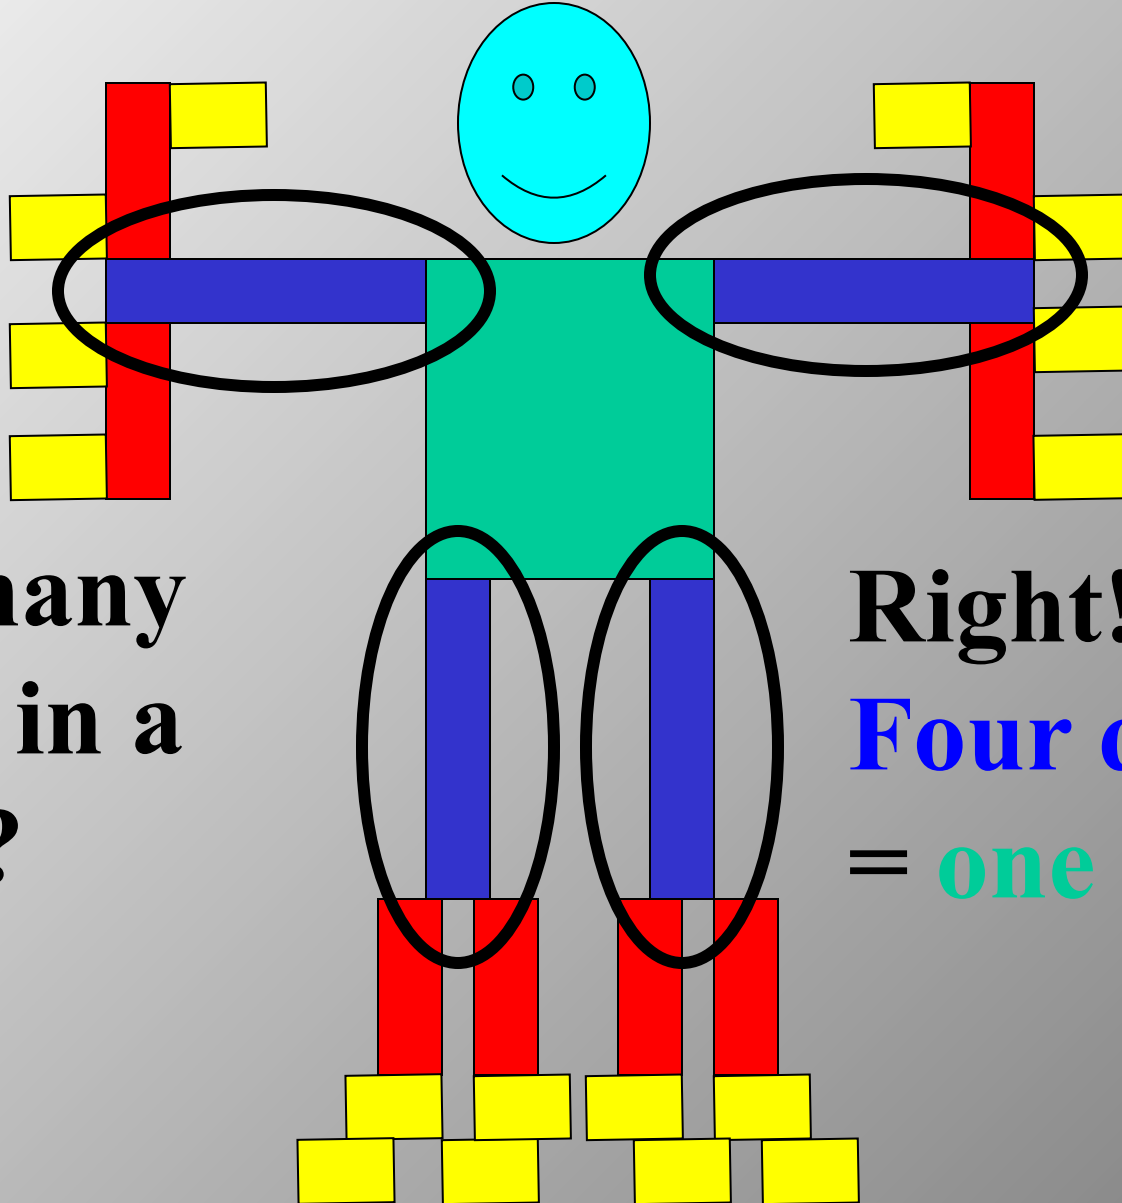

“Gallon Man” and cups

One Pint
= Two Cups

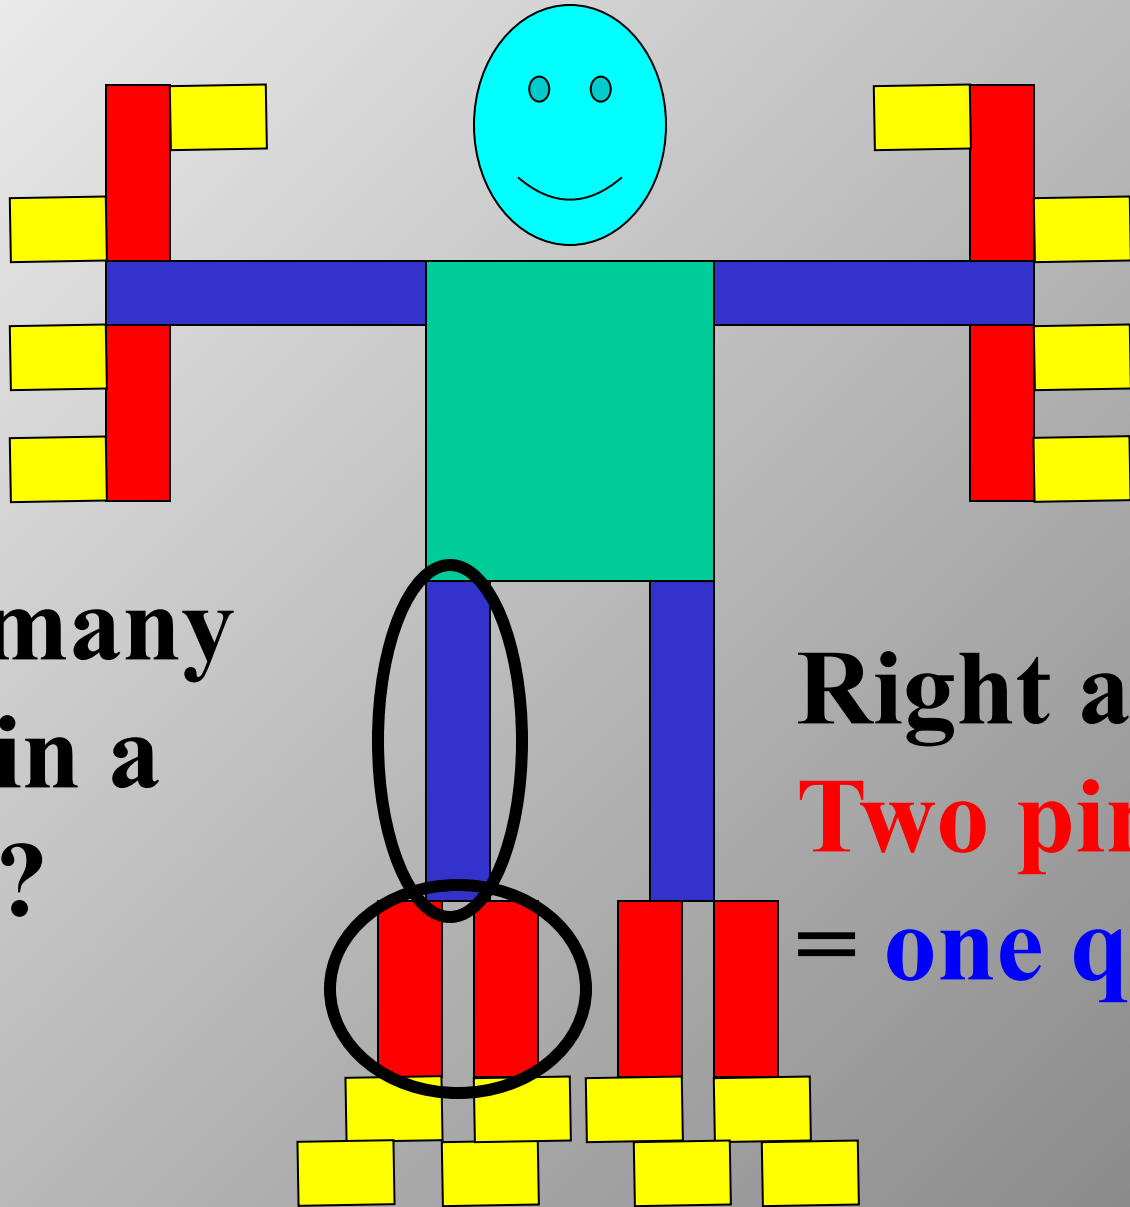

1 Gallon
= 4 quarts
= (4) (2)
= 8 pints
= (8) (2)
= 16 cups

Let's do some more.

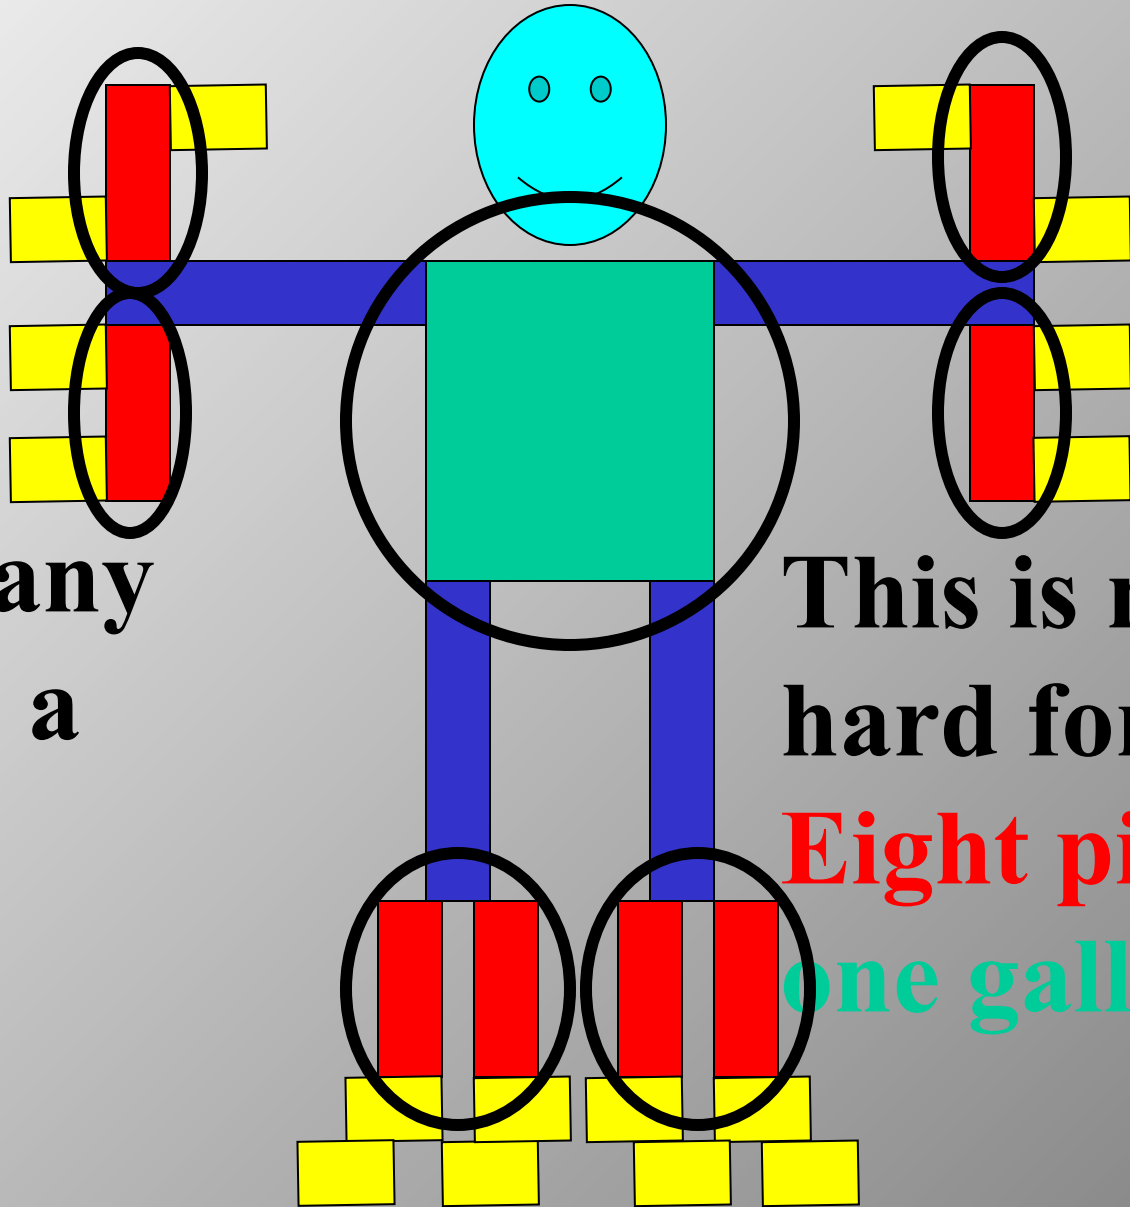

How many
quarts in a
gallon?

Right!
Four quarts
= one gallon!

How many
pints in a
quart?

Right again !
Two pints
= **one quart.**

How many
pints in a
gallon?

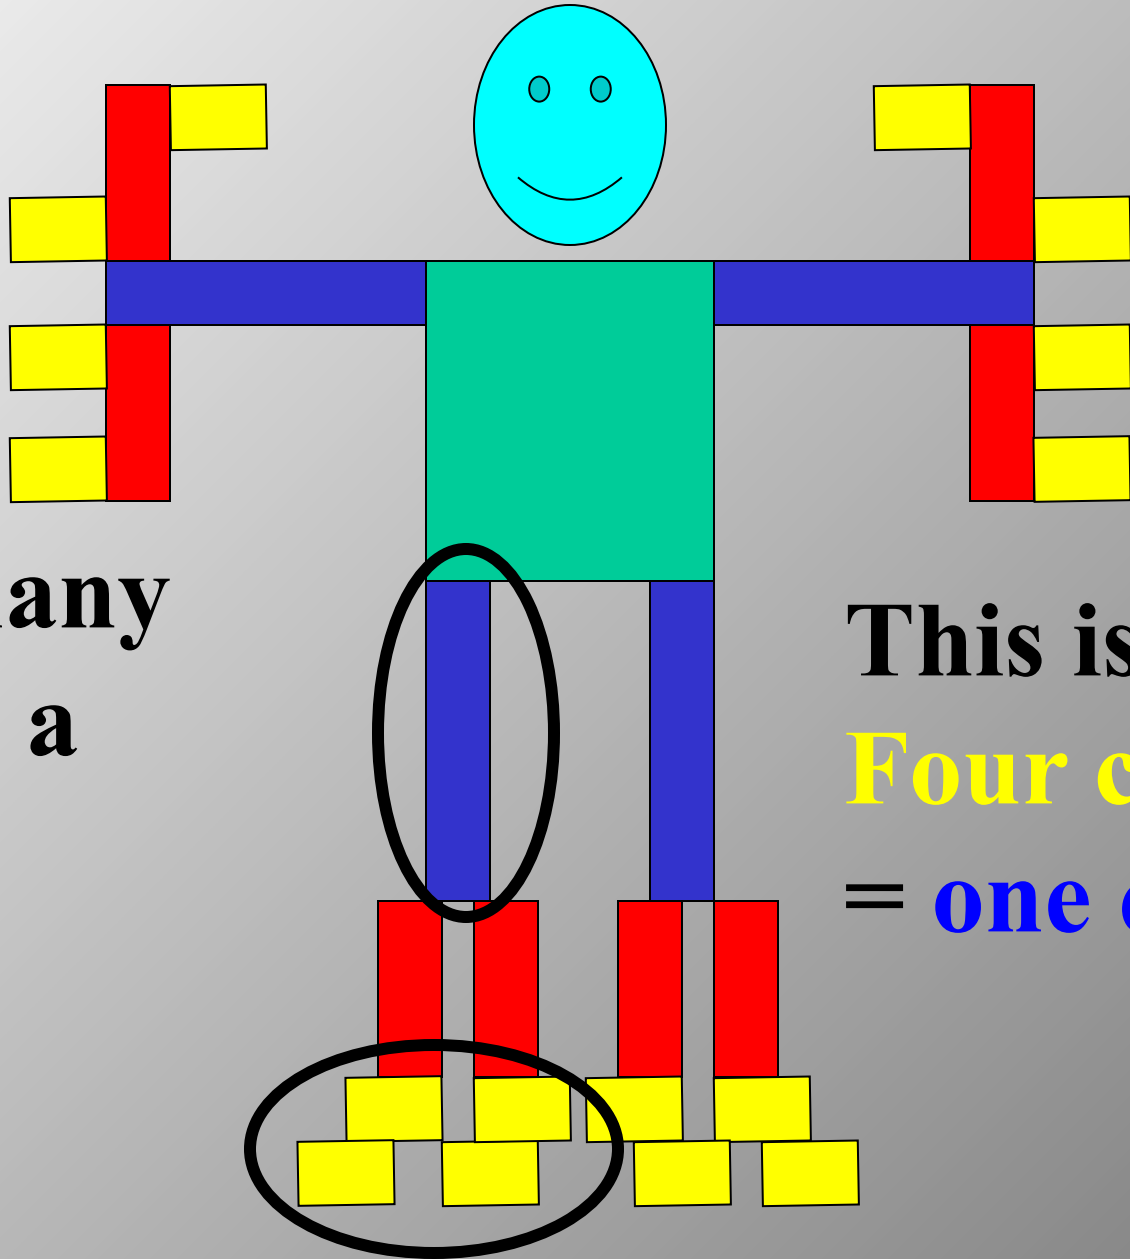

This is not even
hard for you!
Eight pints =
one gallon.

How many
cups in a
pint?

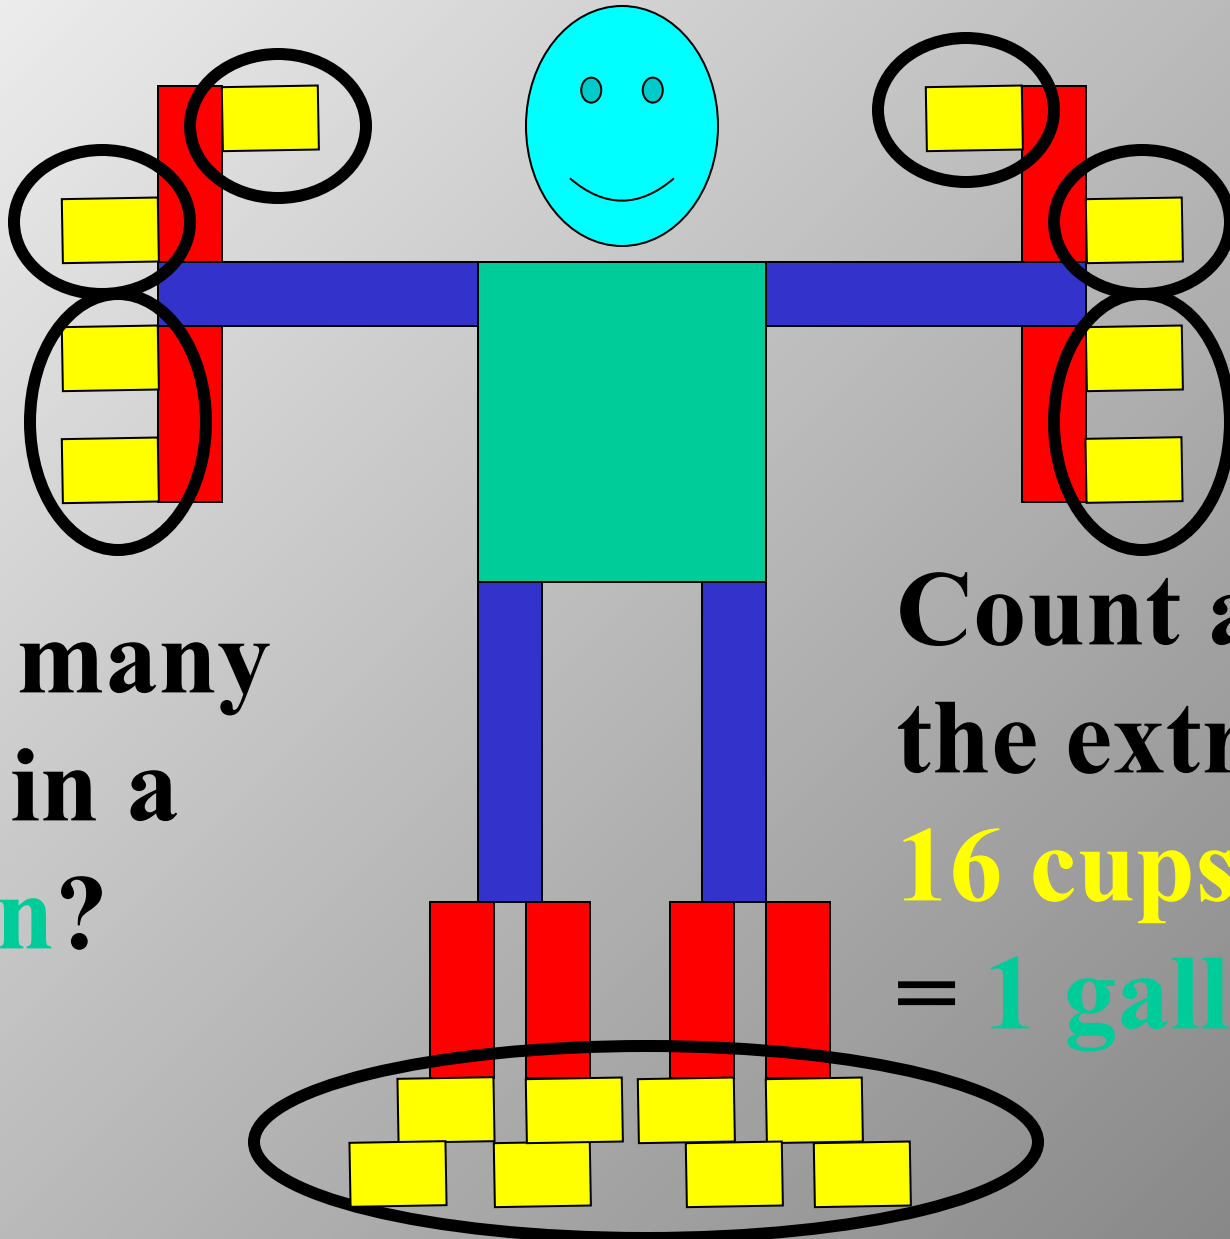

None of these
are difficult.

**Two cups =
one pint**

**How many
cups in a
quart?**

**This is easy!
Four cups
= one quart**

How many
cups in a
gallon?

Count all of
the extremes.
16 cups
= **1 gallon**

Gallon Man can help us some more.

You know the **Gallon Man** along with all of his parts: **quarts**, **pints**, and **cups**.

Let's draw another gallon man and label his parts using **fractions**.

**This turns Gallon Man
into...**

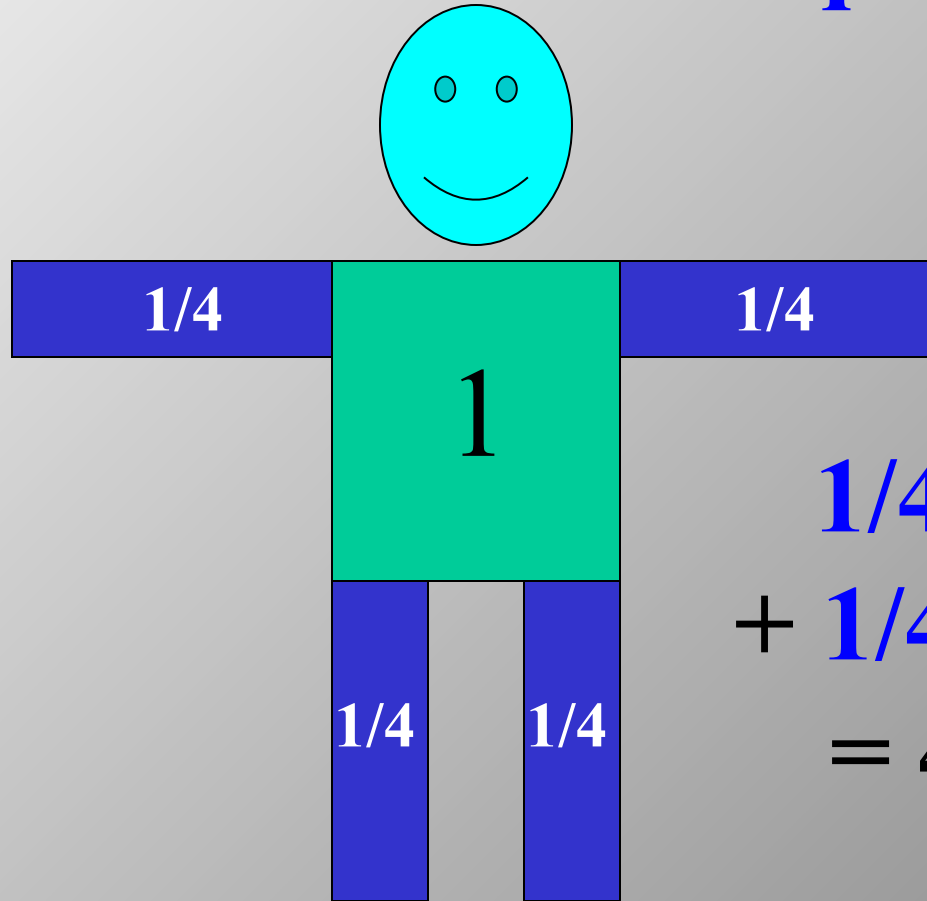

**Fraction
Friend!**

**We built “Fraction Friend”
exactly the way we built
“Gallon Man.”**

One gallon = One whole

“Fraction Friend” and quarters

$$\begin{aligned} & \frac{1}{4} + \frac{1}{4} \\ + & \frac{1}{4} + \frac{1}{4} \\ = & \frac{4}{4} = 1. \end{aligned}$$

One **gallon** = 1 whole

There are **4 quarts** in **one gallon**, so each **quart** is 1 of 4 parts, or $\frac{1}{4}$ of a **gallon**.

“Fraction Friend” and eights

$$\begin{aligned} & \frac{1}{8} + \frac{1}{8} \\ & + \frac{1}{8} + \frac{1}{8} \\ & + \frac{1}{8} + \frac{1}{8} \\ & + \frac{1}{8} + \frac{1}{8} \\ & = \frac{8}{8} = 1. \end{aligned}$$

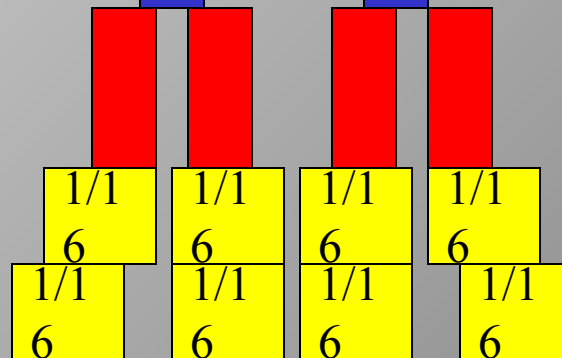

There are **8 pints** in **one gallon**, so each **pint** is 1 of 8 parts, or **$\frac{1}{8}$** of a **gallon**.

“Fraction Friend” and sixteenths

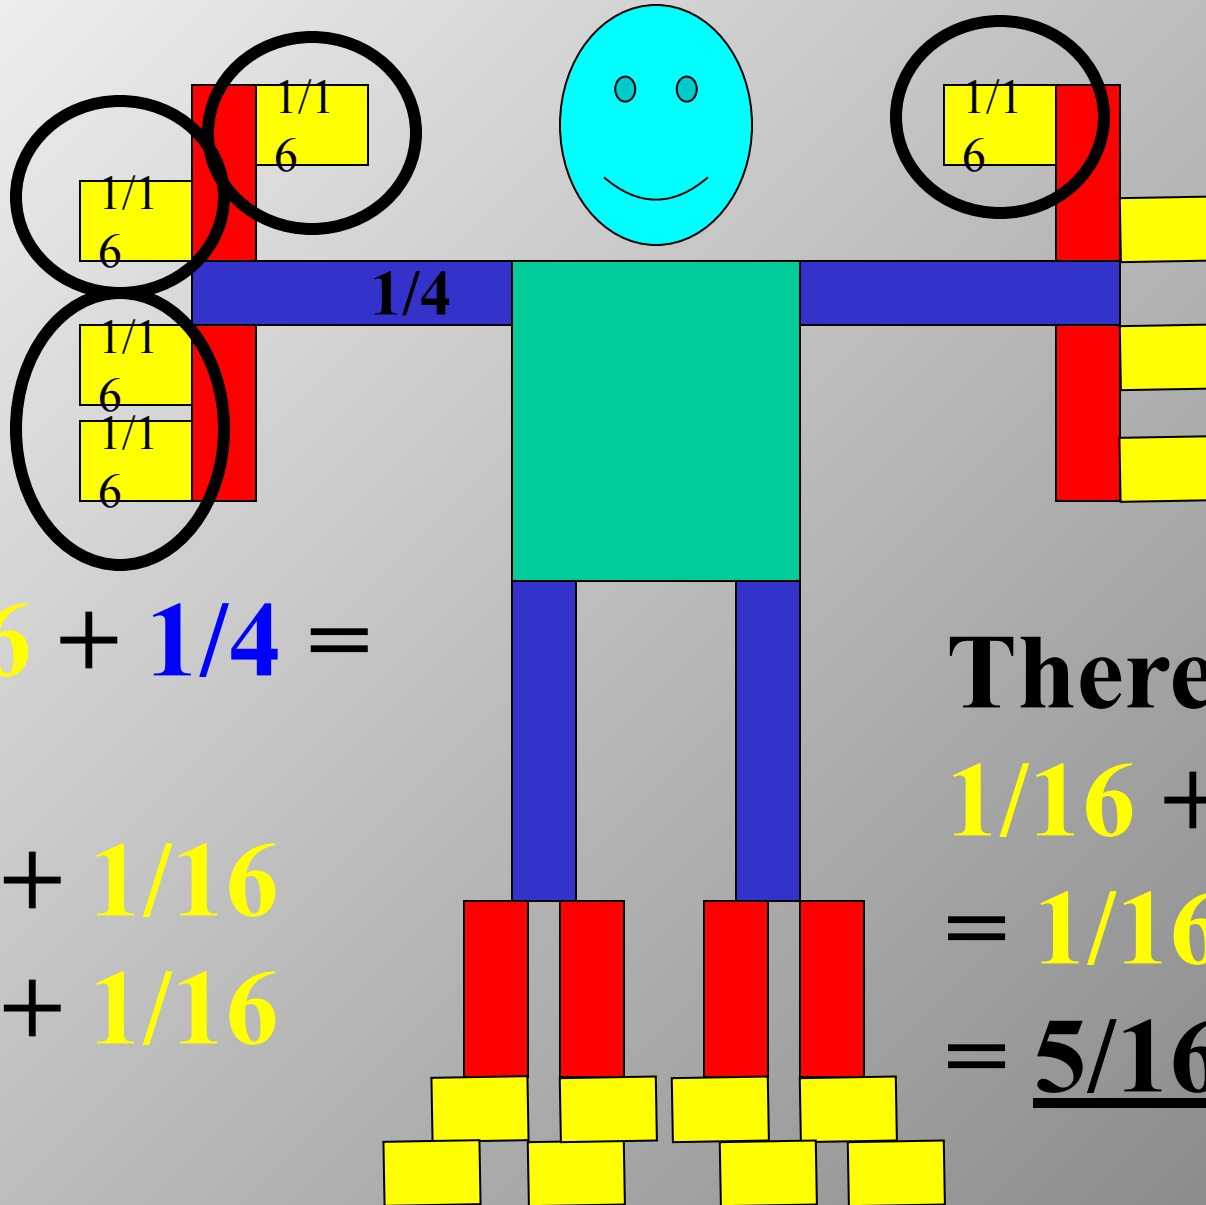

There are **16 cups** in **one gallon**, so each **cup** is 1 of 16 parts, or **1/16** of a **gallon**.

$$\begin{aligned}
 & 1/16 + 1/16 \\
 & + 1/16 + 1/16 \\
 & + 1/16 + 1/16 \\
 & + 1/16 + 1/16 \\
 & + 1/16 + 1/16 \\
 & + 1/16 + 1/16 \\
 & + 1/16 + 1/16 \\
 & + 1/16 + 1/16 \\
 & + 1/16 + 1/16 \\
 & = 16/16 = 1.
 \end{aligned}$$

Let's do this one.

$$\begin{aligned} & 1/16 + 1/4 = \\ & 1/4 \\ & = 1/16 + 1/16 \\ & + 1/16 + 1/16 \\ & = 4/16 \end{aligned}$$

Therefore,

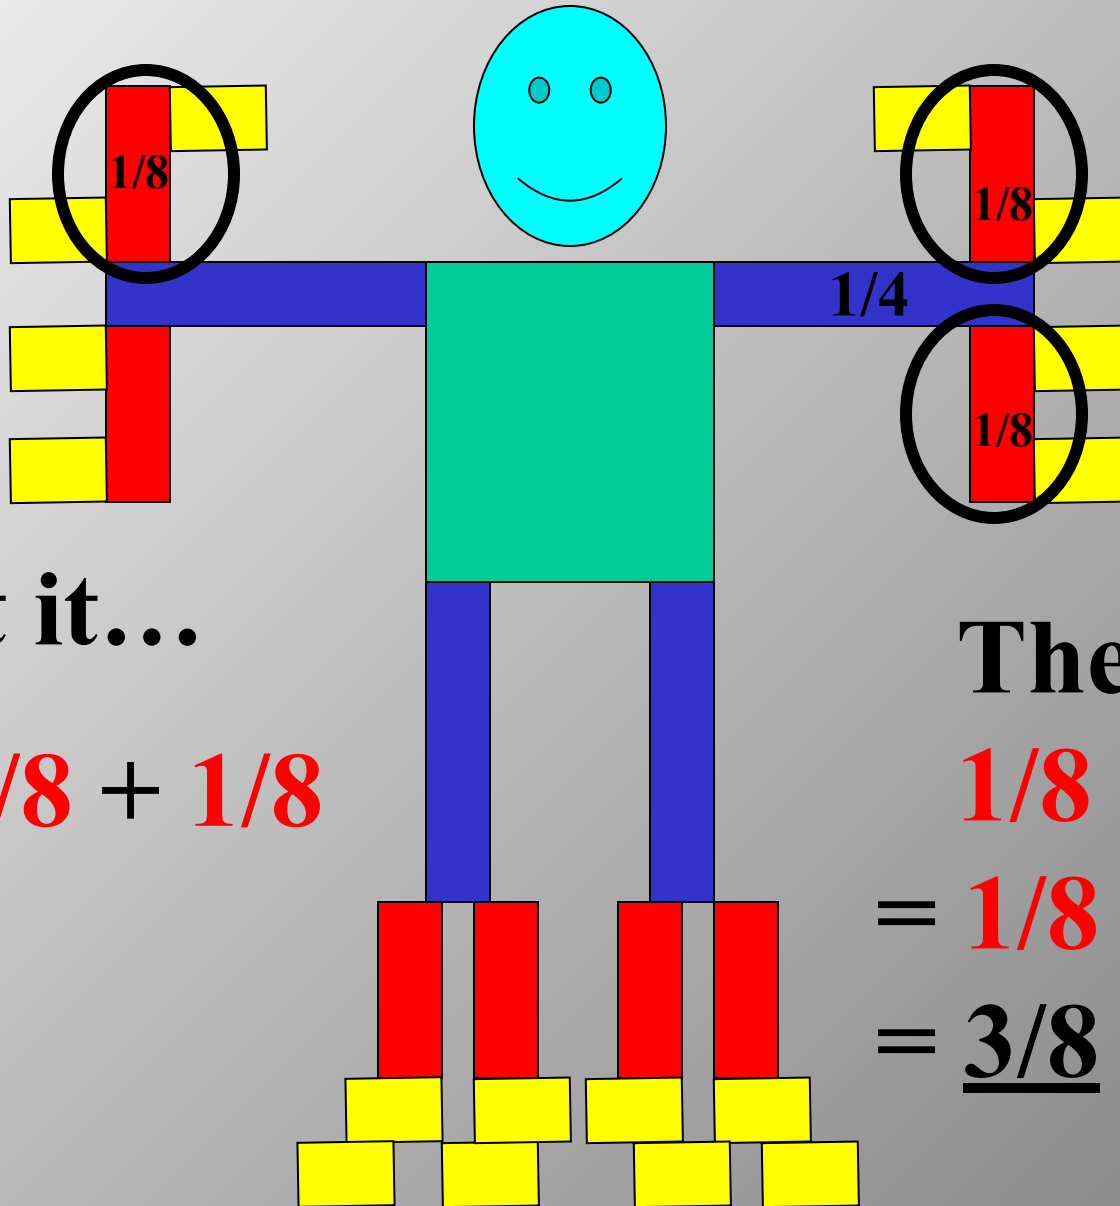

$$\begin{aligned} & 1/16 + 1/4 \\ & = 1/16 + 4/16 \\ & = \underline{5/16} \end{aligned}$$

Here's another one.

You try...

$$\frac{1}{8} + \frac{1}{4} =$$

You got it...

$$\begin{aligned} \frac{1}{4} &= \frac{1}{8} + \frac{1}{8} \\ &= \frac{2}{8} \end{aligned}$$

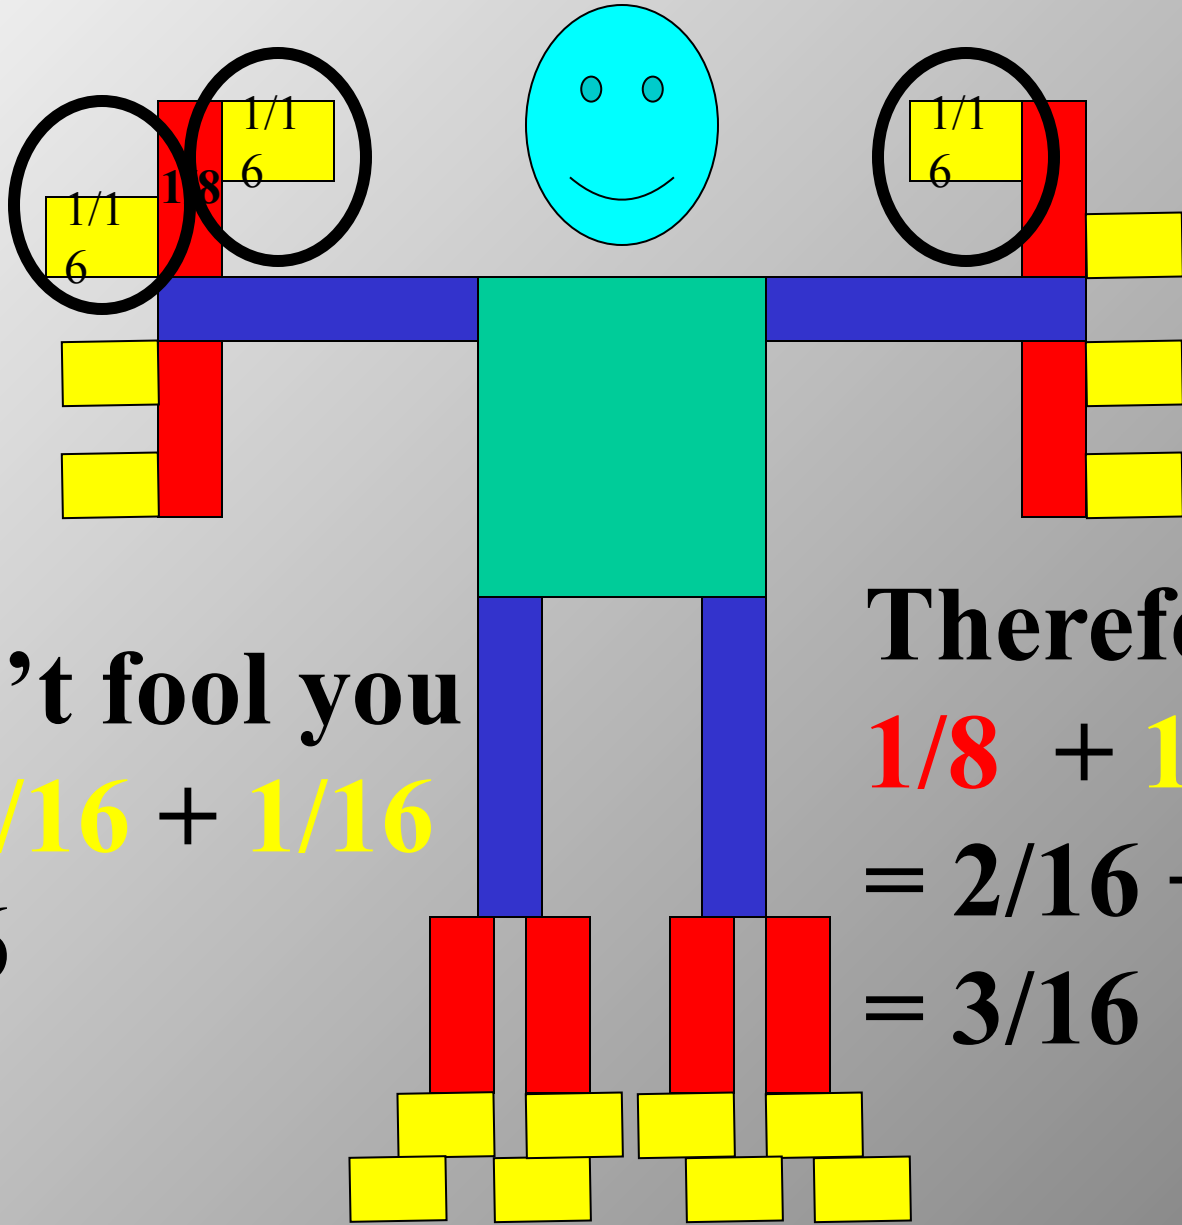

Therefore,

$$\begin{aligned} &\frac{1}{8} + \frac{1}{4} \\ &= \frac{1}{8} + \frac{2}{8} \\ &= \underline{\underline{\frac{3}{8}}} \end{aligned}$$

And...

$$\mathbf{1/8} + \mathbf{1/16} =$$

Couldn't fool you
 $1/8 = 1/16 + 1/16$
 $= 2/16$

Therefore,
 $1/8 + 1/16$
 $= 2/16 + 1/16$
 $= 3/16$

The **Gallon Man** helps us remember: **quarts**, **pints** and **cups**.

Fraction Friend helps us with: **quarters**, **eighths** and **sixteenths**.

Now let's see if we can apply what we have learned from **Fraction Friend** to fractions with other denominations .
