

Note: This will need to cascade

Note: when a prescription is created from the overview, the PrescPlacer , besides working as a consumer, may create a prescription that may go through the national repository, but may also directly feed the “consumer” system, indicating that the overview is now (tentatively) updated with a new prescription. This may need to be updated with any information from the “national” repository - e.g. if the prescription fails, the Consumer should see this update.
