

# Merge Sort

---

Week 4 Lesson 2

# Sorting

---

- Insertion sort
  - Design approach: incremental
  - Sorts in place: Yes
  - Best case:  $\Theta(n)$
  - Worst case:  $\Theta(n^2)$
- Bubble Sort
  - Design approach: incremental
  - Sorts in place: Yes
  - Running time:  $\Theta(n^2)$

# Sorting

---

- Selection sort
  - Design approach: incremental
  - Sorts in place: Yes
  - Running time:  $\Theta(n^2)$
- Merge Sort
  - Design approach: divide and conquer
  - Sorts in place: No
  - Running time: Let's see!!

# Divide-and-Conquer

---

- **Divide** the problem into a number of sub-problems
  - Similar sub-problems of smaller size
- **Conquer** the sub-problems
  - Solve the sub-problems recursively
  - Sub-problem size small enough  $\Rightarrow$  solve the problems in straightforward manner
- **Combine** the solutions of the sub-problems
  - Obtain the solution for the original problem

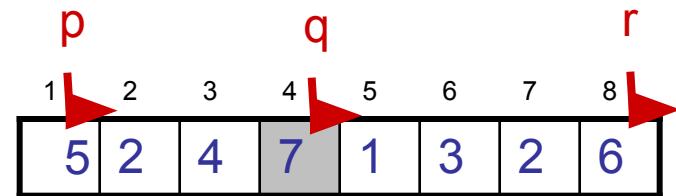

# Merge Sort Approach

---

- To sort an array  $A[p \dots r]$ :
- **Divide**
  - Divide the  $n$ -element sequence to be sorted into two subsequences of  $n/2$  elements each
- **Conquer**
  - Sort the subsequences recursively using merge sort
  - When the size of the sequences is 1 there is nothing more to do
- **Combine**
  - Merge the two sorted subsequences

# Merge Sort

*Alg.:* MERGE-SORT( $A, p, r$ )

if  $p < r$

Check for base case

then  $q \leftarrow \lfloor (p + r)/2 \rfloor$

Divide

MERGE-SORT( $A, p, q$ )

Conquer

MERGE-SORT( $A, q + 1, r$ )

Conquer

MERGE( $A, p, q, r$ )

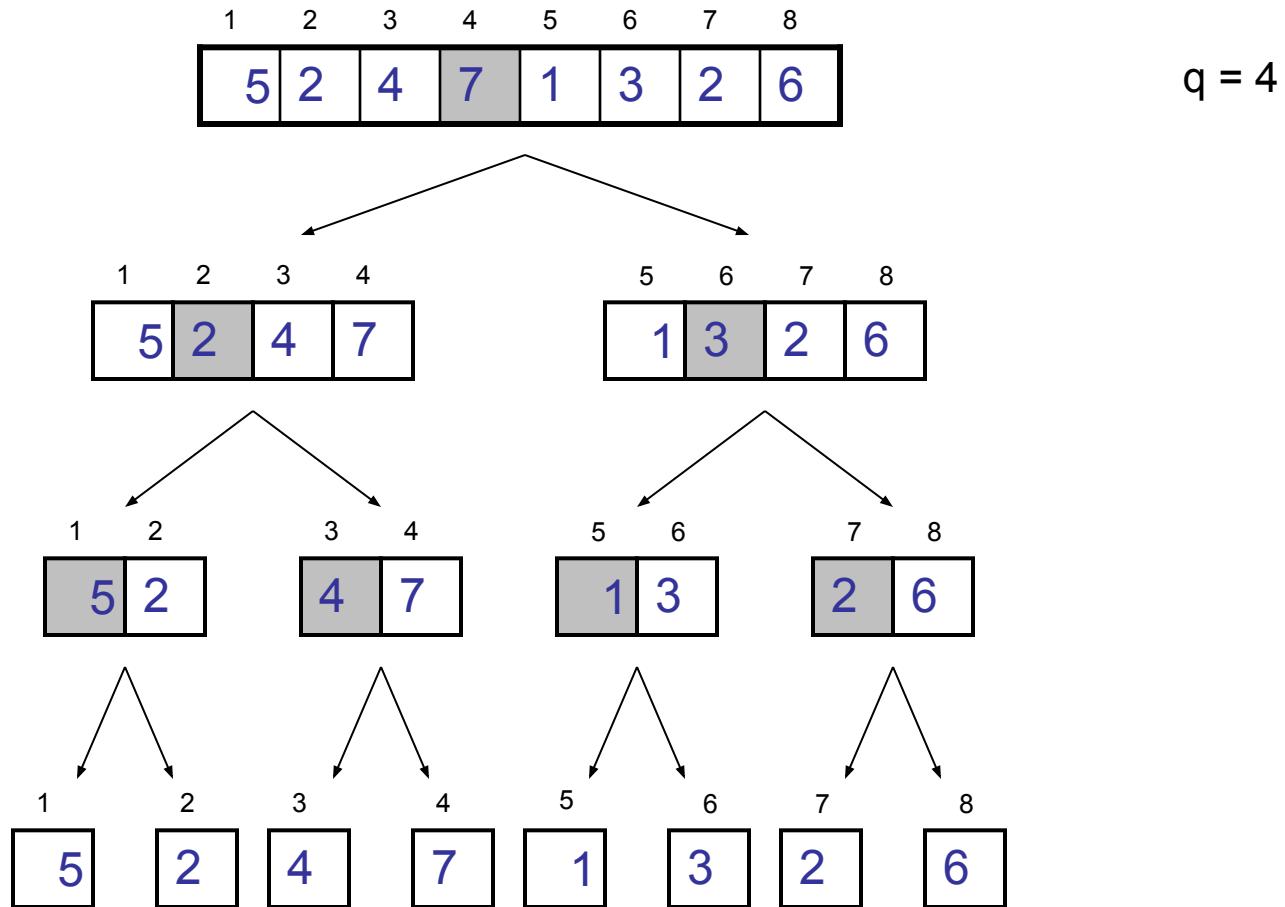

Combine

- Initial call: MERGE-SORT( $A, 1, n$ )

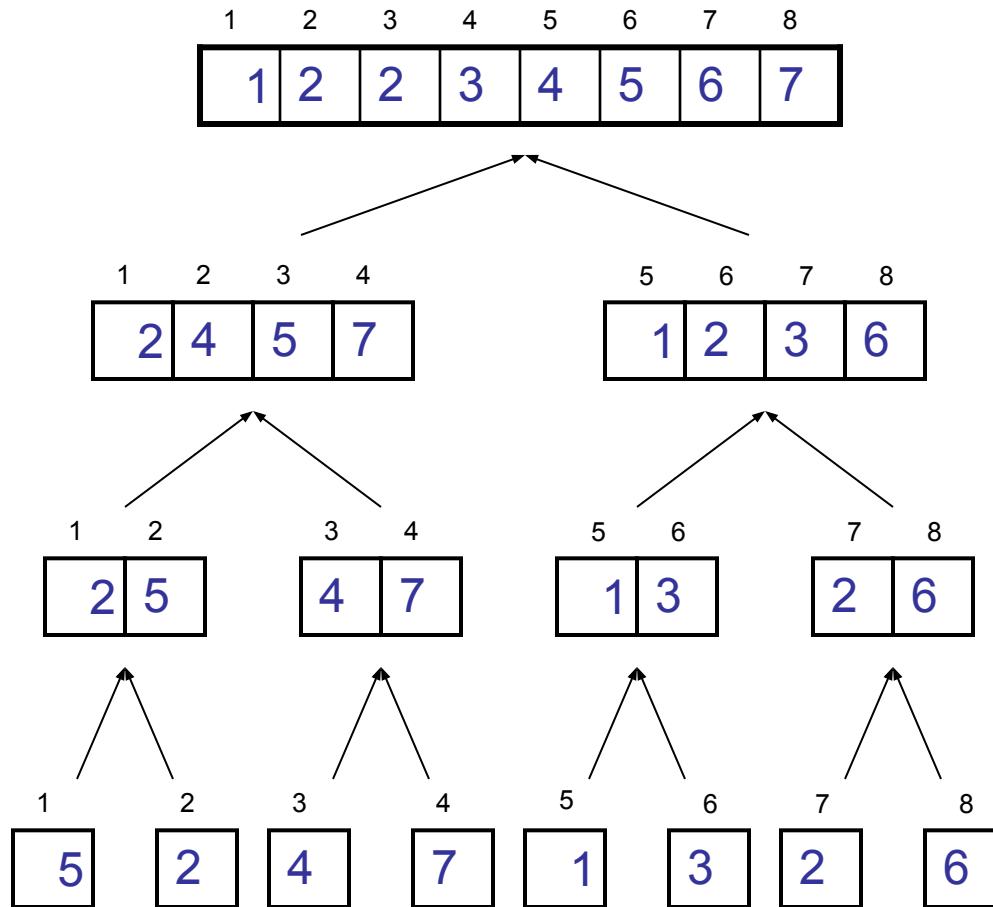

# Example – n Power of 2

Divide

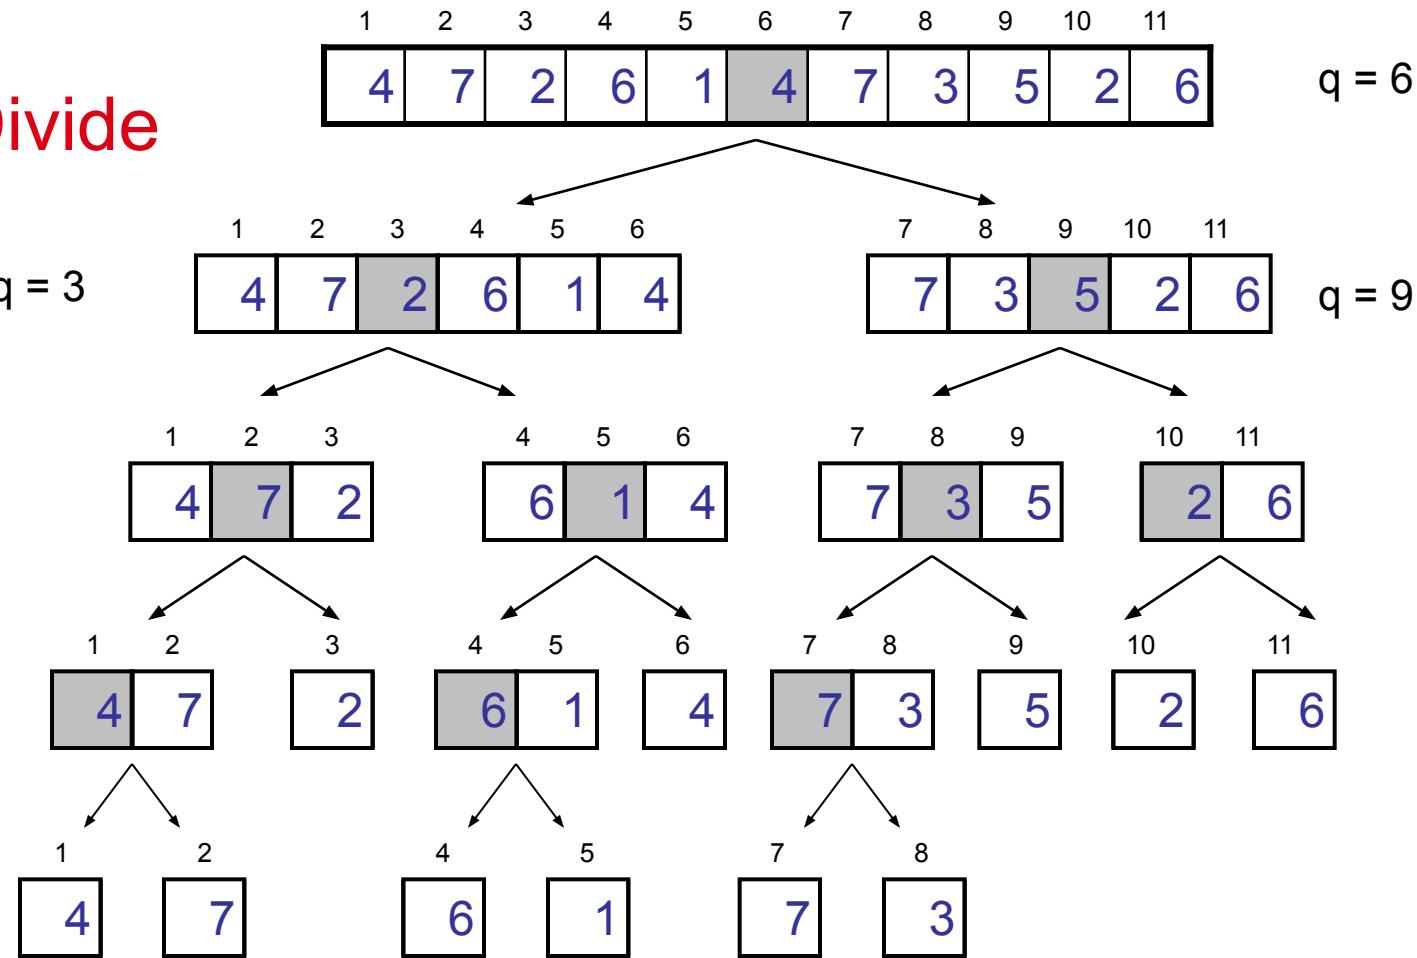

# Example – $n$ Power of 2

Conquer  
and  
Merge

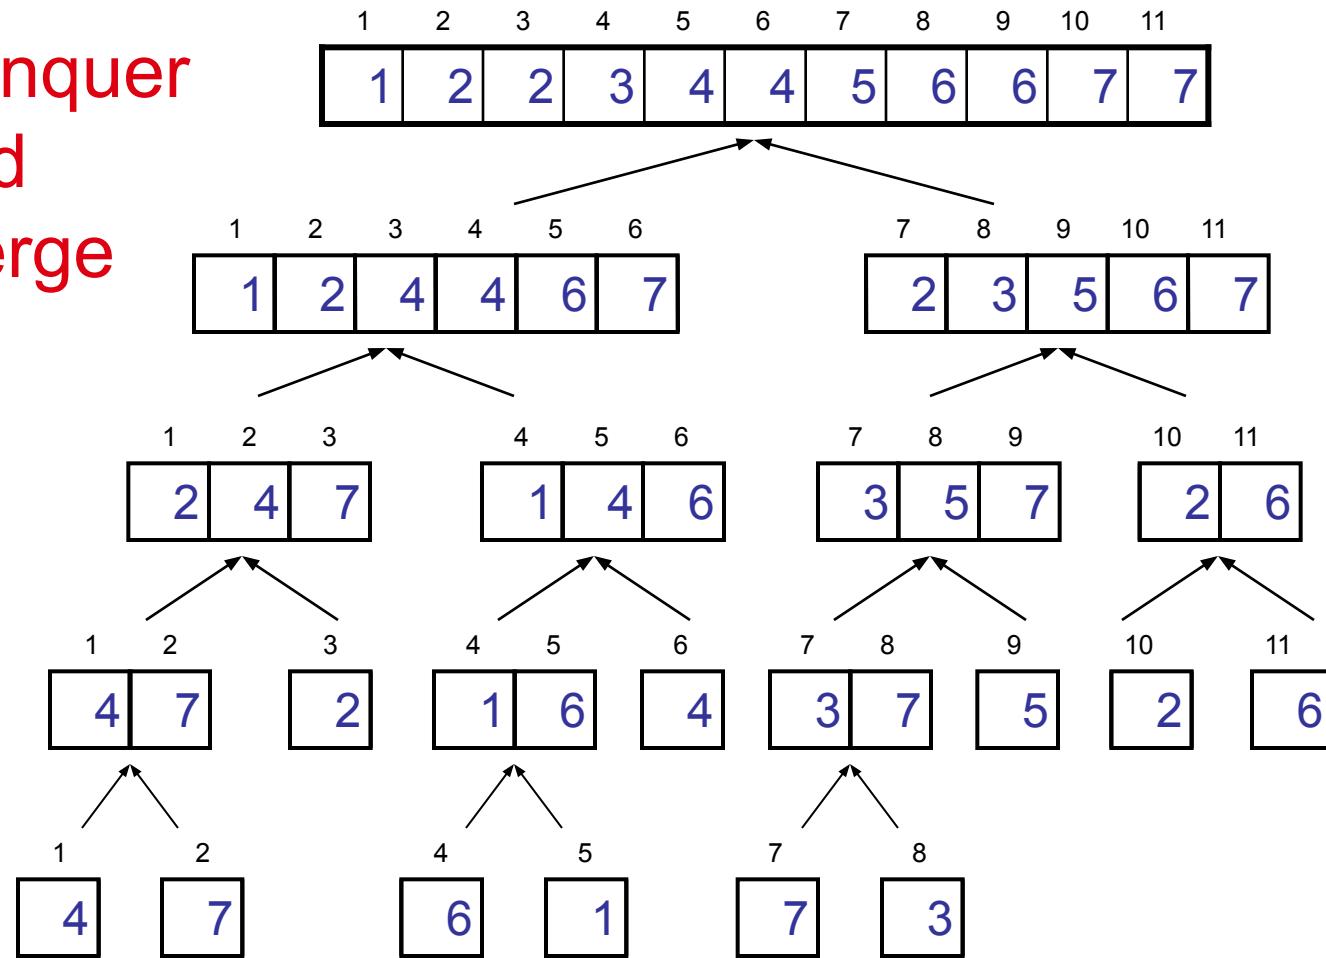

# Example – $n$ Not a Power of 2

Divide

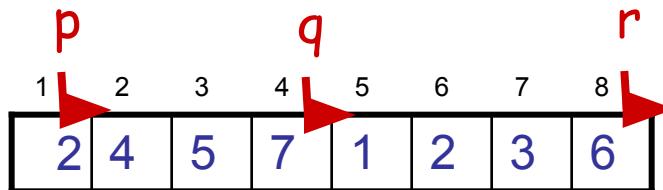

# Example – n Not a Power of 2

Conquer  
and  
Merge

# Merging

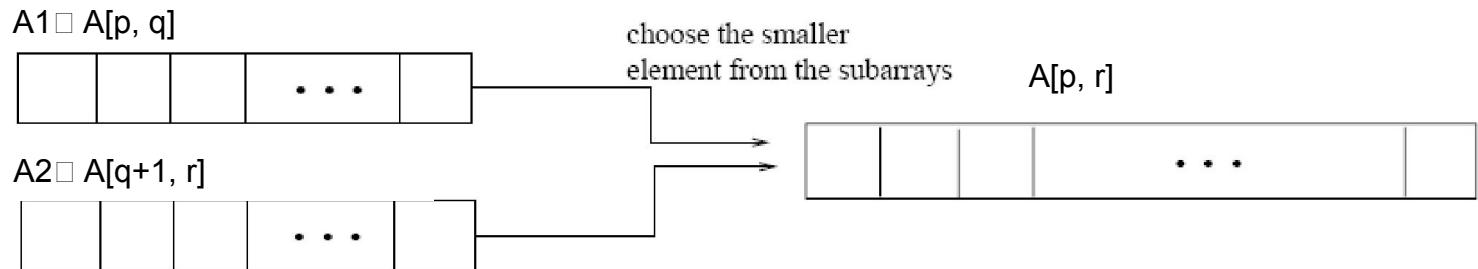

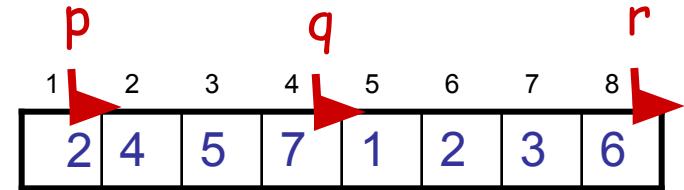

---

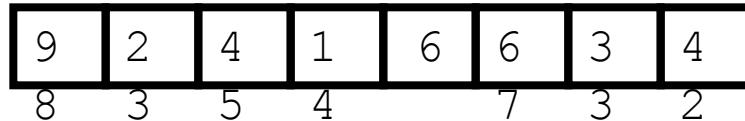

- **Input:** Array  $A$  and indices  $p, q, r$  such that  $p \leq q < r$ 
  - Subarrays  $A[p \dots q]$  and  $A[q + 1 \dots r]$  are sorted
- **Output:** One single sorted subarray  $A[p \dots r]$

# Merging

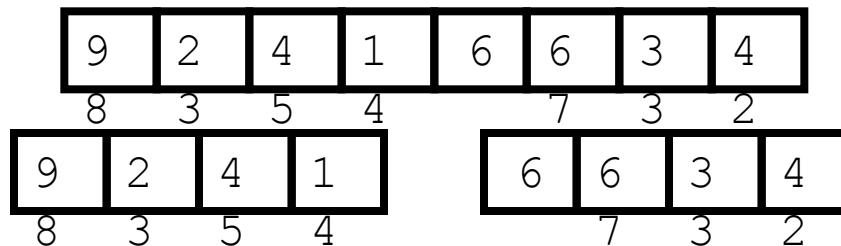

- Idea for merging:
  - Two piles of sorted cards
    - Choose the smaller of the two top cards
    - Remove it and place it in the output pile
  - Repeat the process until one pile is empty
  - Take the remaining input pile and place it face-down onto the output pile

9	2	4	1	6	6	3	4
8	3	5	4	6	7	3	2

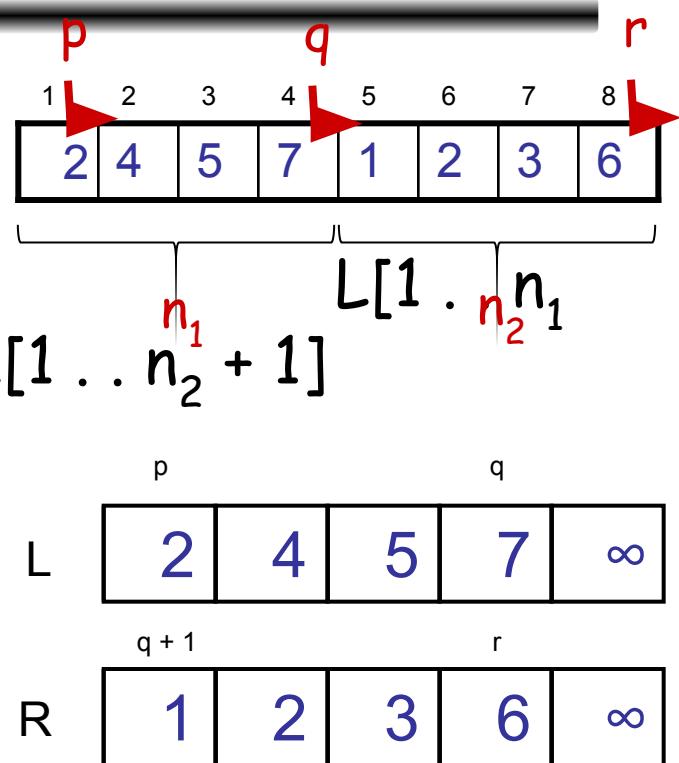

6	1	2	3	4	4	6	9
4	3	3	3	2	5	7	8

# Merge - Pseudocode

*Alg.:* MERGE( $A, p, q, r$ )

1. Compute  $n_1$  and  $n_2$
2. Copy the first  $n_1$  elements into  $L[n_1 + 1]$  and the next  $n_2$  elements into  $R[n_2 + 1]$
3.  $L[n_1 + 1] \leftarrow \infty; R[n_2 + 1] \leftarrow \infty$
4.  $i \leftarrow 1; j \leftarrow 1$
5. **for**  $k \leftarrow p$  **to**  $r$
6.     **do if**  $L[i] \leq R[j]$
7.         **then**  $A[k] \leftarrow L[i]$
8.              $i \leftarrow i + 1$
9.         **else**  $A[k] \leftarrow R[j]$
10.          $j \leftarrow j + 1$

# Merge Sort - Discussion

---

- Running time insensitive of the input
- Advantages:
  - Guaranteed to run in  $\Theta(n \lg n)$
- Disadvantage
  - Requires extra space  $\approx N$

# Sorting Challenge 1

---

**Problem:** Sort a file of huge records with tiny keys

Example application: Reorganize your MP-3 files

**Which method to use?**

- A. merge sort, guaranteed to run in time  $\sim N \lg N$
- B. selection sort
- C. bubble sort
- D. a custom algorithm for huge records/tiny keys
- E. insertion sort

# Sorting Files with Huge Records and Small Keys

---

- Insertion sort or bubble sort?
  - NO, too many exchanges
- Selection sort?
  - YES, it takes **linear** time for exchanges
- Merge sort or custom method?
  - Probably not: selection sort simpler, does less swaps

# Sorting Challenge 2

---

**Problem:** Sort a huge randomly-ordered file of small records

**Application:** Process transaction record for a phone company

**Which sorting method to use?**

- A. Bubble sort
- B. Selection sort
- C. Mergesort guaranteed to run in time  $\sim N \lg N$
- D. Insertion sort

# Sorting Huge, Randomly - Ordered Files

---

- Selection sort?
  - NO, always takes quadratic time
- Bubble sort?
  - NO, quadratic time for randomly-ordered keys
- Insertion sort?
  - NO, quadratic time for randomly-ordered keys
- Mergesort?
  - YES, it is designed for this problem

# Sorting Challenge 3

---

**Problem:** sort a file that is already almost in order

Applications:

- Re-sort a huge database after a few changes
- Doublecheck that someone else sorted a file

**Which sorting method to use?**

- A. Mergesort, guaranteed to run in time  $\sim N \lg N$
- B. Selection sort
- C. Bubble sort
- D. A custom algorithm for almost in-order files
- E. Insertion sort

# Sorting Files That are Almost in Order

---

- Selection sort?
  - NO, always takes quadratic time
- Bubble sort?
  - NO, bad for some definitions of “almost in order”
  - Ex: B C D E F G H I J K L M N O P Q R S T U V W X Y Z A
- Insertion sort?
  - YES, takes linear time for most definitions of “almost in order”
- Mergesort or custom method?
  - Probably not: insertion sort simpler and faster

# Sorting Applications

---

**Sorting algorithms are essential in a broad variety of applications**

- Sort a list of names.
  - Organize an MP3 library.
  - Display Google PageRank results.
  - List RSS news items in reverse chronological order.
- 
- Find the median.
  - Find the closest pair.
  - Binary search in a database.
  - Identify statistical outliers.
  - Find duplicates in a mailing list

**Now I know merge sort!**
