Answer	
Difficult or labored breathing	
Weakness or paralysis on one side of the body	
Slow heart rate	
Rapid breathing	
Cardiac glycoside used to treat heart failure and atrial fibrillation	
Loop diuretic used to treat edema and hypertension	
Regulation of fluid and electrolyte balance, elimination of waste products, production of hormones, maintenance of acid-base balance	
Epidermis, dermis, subcutaneous tissue	
Atria, ventricles, valves, arteries, veins	
Verify patient's identity, assess blood glucose level, select injection site, administer insulin, monitor patient for signs of hypoglycemia	
Verify patient's identity, assess nasal passages, measure and mark the tube, lubricate the tube, insert the tube, confirm placement by auscultation and pH testing	
Verify patient's identity, assess wound appearance and drainage, prepare wound bed and surrounding skin, remove old dressing, clean wound and apply new dressing, secure the dressing	
Interventions - Administer oxygen therapy, assess respiratory status, encourage deep breathing and coughing, position patient for optimal ventilation	
Interventions - Assess patient's mobility and balance, implement fall prevention measures (e.g. bed rails, non-skid socks), educate patient on fall prevention strategies, ensure adequate lighting	
Interventions - Assess pain level and location, administer pain medication as ordered, implement non-pharmacologic pain management strategies (e.g. heat therapy, distraction), reassess pain after interven	tions
Examples - Warfarin, Heparin, Enoxaparin, Apixaban, Rivaroxaban, Dabigatran	
ns Nausea, vomiting, constipation, dizziness, drowsiness, respiratory depression	
Penicillins, Cephalosporins, Macrolides, Aminoglycosides, Tetracyclines, Fluoroquinolones	
Hypovolemic, Cardiogenic, Distributive, Obstructive
