

Méthodologie

But: comparer les hospitalisations selon la classe d'âges et selon le statut vaccinal, à **population égale**, pour mesurer les effets de la vaccination sur la charge hospitalière en Suisse

Période observée: du 11 octobre au 12 décembre 2021 (semaine 41 à 49), le 11 octobre correspond au début de la 5e vague

Données utilisées: nouvelles admissions à l'hôpital pour Covid-19 par classes d'âges avec statut vaccinal connu (source: OFSP, téléchargée le 16 décembre)

Note sur les données: nous avons utilisé les données avec un statut vaccinal connu, dans environ 13% des hospitalisations le statut vaccinal n'est pas connu. Les retards dans les enregistrements sont fréquents, notamment pour le canton de Genève en novembre, les données pourraient donc être complétées à l'avenir. Enfin, ces données ne prennent pas en compte la durée de l'hospitalisation.

Méthode: pour rapporter le nombre d'hospitalisations à la population concernée, afin de pouvoir comparer les chiffres à population égale, nous utilisons la population moyenne sur la période observée. Les personnes "partiellement vaccinées" ne sont pas prises en compte (nombre très faible sur la période observée). Par exemple, les hospitalisations de personnes vaccinées de plus de 80 ans sont rapportées à la population vaccinée de plus de 80 ans, et les hospitalisations de personnes non vaccinées de plus de 80 ans sont rapportées à la population non vaccinée de plus de 80 ans.

Résultats: voir feuille resultats_hospitalisations

Analyse complémentaire: voir feuille analyse_complementaire
