ID	Abstract This document provides three main contributions. First, it details the Self-Sovereign Identify concept including its underlying blockchain technology. Second, related technologies are identified; evaluation criteria are	Keywords	Concepts
<u>26</u>	In sociument provides three main communices, risk, it details the Self-sovereign noming concept noturing is underlying blockchain technology. Second, related technologies are identified and details details the solar block technologies. Finally, the SSI potential is identified and described. Centralised identify services that exist today fail to operate transparently and protect the rights of users. Single points of frust present constant operational risks for both companies and individuals. Self-sovereign	concepts; requirements	Proposes six requirements for SSI systems
27.	identity is a solution to address this, which specifies a user-focused approach that gives full control of an identity back to the individual. This paper proposes the blockchain, a secure and decentralised trust-less system, as the platform to achive the A. A portof-focuscing identity system for the Ethereum blockchain is designed and developed in this paper. Smart contracts are used to facilitate the secure storage and open processing of user data. It also presents a novel approach to the secure recovery of encrypted private data. Emphasis is placed on the implementation security, information privacy and data recovery procedures of the system.	theoretical; definitions; concepts; requirements	Despite implementing a SSI system, introduce a few requirements which can be used for all SSI systems.
30	Self-sovereign identity management is a new paradigm, ignited by biockchain technology. The field of identity management rule raises is unally faces issues in multiple areas. Usenity thet and data breaches are not uncommon, and are often the result of inserver identity management paradises. Identity management rule raises are sovereign identity paradigm places the subject central to their own administration. To facilitate a self- operation is and the self-self-self-self-self-self-self-self-	theoretical; definitions; concepts; requirements	Through expert interview a set of requirements were conceived for a SSI system
34	need for trust in large institutions. Removing the need for a fusted third party, blockchain technology revolutionizes the field of identity management. Service providers rely on digital identities to securely identify, authenticate and authorize users to their services. Traditionally, these digital identities are offered by a central identity provider belonging to a specific organisation. Trusts in the digital identities to securely identify, authenticate and authorize users to diversity of the secure of the se	application; trust; distributed ledger; reputation; trust model	a trust model for blockchain based SSI
<u>35</u>	Digital identity is unsweat After many years of research there is still no trusted communication over the Internet. To provide identity within the context of mutual distrust, this paper presente a blockchain-based digital identity solution. Without depending upon a single trusted third party, the proposed solution achieves passport-level legally valid identity. This solution for making identities Self-Sovereign, builds on a generic provable claim model for which attrastations of ruth from third parties need to be collected. The claim model is then shown to be toth blockchain situcture and provement on tendora in support of these two claim model for which attrastations is considered to be achieved to be collected. The claim model is then shown to be toth blockchain situcture and provements. Four different implementations in support of these two claim model for properties are shown to offer sub-eccond performance for claim creation and claim verification. Through the properties of Self-Sovereign Identity, legally valid status and acceptable performance, our solution is considered to be if for adoption by the general public.	theoretical; definition; concept; claim format; claim metamodel; verifiable claims;	Proposed a metamodel for claims and the requirement that claims must be verifiable in a SSI system
<u>37</u>	Self-sovereign identity promise prospective users greater control, security, privacy, portability and versal greater convenince, however the immalurity of current distributed key management solutions results in general disregard of security advorces in factory of convenience and accessfully. This research proposes the use of immerediate conficience as a distributed key management solution, instrumediate conficience as a distributed key management solution is a superior alternative to existing key recovery and escrew systems in heiping users recover when their keys are lost or compromised. These features will allow the two remote condentials to be used to issuer, present and approprise remote attrabilities, without refersion on a constant internet concercion.	application; certificates; key-rotation; recovery; key management;	propose key rotation for soverign entities instead o key recover through DID's key rotation
38	This paper provides an overview of the Self-Sovereign Identity (SSI) concept, focusing on four different components that we identified as essential to the architecture. Self-Sovereign Identity is enabled by the new development of blockchain technology. Through the trustees, decentralised database that is provided by a blockchain, classic lidentity Management registration processes can be replaced. We start of by ying a simple overview of blockchain technology. Through the trustees, decentralised database that is provided by a blockchain technology. Through the trustees, decentralised database that is provided by a blockchain technology. The processes can be replaced. We start of by ying a simple overview of blockchain technology. Somethy, the provided by a blockchain technology of an operative, namely the Identifier Registry Model and the SSI has to be interview of will provide a more coherent view of vertifiable claims in regards to blockchain based SSI and the line field are only loosely connected. We will provide a more coherent view of vertifiable claims in regards to blockchain based SSI and claims that are presented with the registry time advantages and diadvantages.	theoretical; definitions; concept; components	On top of Allen's principles, four components are defined as essential.
<u>45</u>	In this paper we present reclaimID: An architecture that allows users to reclaim their digital identifies by securely sharing identity that/butes without the need for a centralised service provider. We propose a design where user attributes are stored in and shared over a name system under user convend namespaces. Attributes are noropided using attribute-based encryption (ABE), allowing the user of selectively approaces. Attributes are noropided using attribute-based encryption (ABE), allowing the user of selectively approaces. Attributes are noropide using attribute-based encryption (ABE), allowing the user to selectively approaces. Attributes are an encrypted using attribute-based encryption (ABE), allowing the user to selectively approach and by the practicaily of our implementation, as a store or a selective approach and a selective anigmentation aspects including attribute resolution performance. Finally, we show that our design can be used as a standard OpenID Connect Identity Provider allowing our implementation to be integrated into standard-compliant services.	application; attribute management; authorization; revoke; claim management;	propose to manage attributes (provided by IDPs) b versioning attributes and granting and revoking access to attributes through tickets
<u>53</u>	The self-sovereign identity management model emerged with the rise of blockhain technology. This paradigm focuses on user-centricity and strives to place the user in full control of the cipital identity. Numerous implementations embace the self-sovereign identity concept, leading to a fragmented landscape of solutions. At the same time, traditional identity and access management protocols are largely discapered and facilities to issue verifiable claims as attributes are not available. Therefore, service providers barely adopt these solutions. We propose a component-based architecture for integrating self-sovereign identity conception by service providers. Furthermore, we outline a sample implementation as a gateway that enables uPort and Jolocom for authentication, via the OpenID Connect protocol, as well as the retrieval of email address attestations for these solutions.	integration; adoption; authentication; authorization;	a framework for integration non-SSI apps and non- SSI identity and attribute providers with SSI-users
<u>57</u>	Identity management is an essential correnstone of securing online services. Service provisioning relies on correct and valid attitudes of a digital identity. Therefore, the identity provider is a tusked third party with a specific trust requirement towards a verified attribute supply. This trust demand implies a significant dependency on users and service providers. We propose a novel attribute aggregation method to reduce the relance on not identity provider. Trust in an attribute is mobiled as a combined assurance of several identity providers based on probability distributions. We formally describe the proposed aggregation model. The resulting trust model is implemented in a gateway that is used for authentication with self-sovereign identity solutions. Thereby, we devise a service provider specific web of trust that constitutes an intermediate approach bridging a global interactional model and constitutes on intermediate approach bridging a global interaction.	application; attribute management; descentralized attribute management; trust; reputation	calculates trust from multiple attribute providers where the RP assigns a probability of validity for attributes from different IDPs
<u>58</u>	We live in a connected world that requires us to identify ourselves every time we want to access our emails, work stations, bank accounds, health care records, etc. Every system we interact with requires us to remember a usemame/password combination, have access to some private/public key pair, a hardware token, or some third party authentication software. Our digital identify is owned by the services we are trying to access, no longer under our control. Self-Sovereign identity promises to give back control of his or her identity to the user. It is in this context that we applies the use of biometrics in order to are prover users to be their own passwords, their own keys, their own means to authenticate themselves. We propose Self-Sovereign Biometric DIS Gentrality, a novel approach that maries the concepts of decentralization, cancelable biometrics. Bioder used without restring to develop a privacy-first stothino capable of allowing users to control how ther biometerics are used without risking their awn biometric implicates.	application; authentication; biometric; identification	developed a cancelable biometric by using filters, noise and one-way functions on a user's selfie
<u>60</u>	In recent times, with the advent of blockchain technology, there is an optimism surrounding the concept of self-sovereing identity winch is regarded to have an influential effect on how we interact with each other over the interact in future. There are a few works in the letterature which examine different aspects of self-sovereing identity. Unfortunately, the existing works are not methodological and comprehensive selfs Moreover, there exist different notions of what the term self-sovereing identity during and methinatical model. This paper asmines the properties that a self-sovereing identity should have and applied in these title-cycles. In addition, the paper illustrates several envisioned flows involving a self-sovereing indentity should have and applied in these title-cycles. In addition, the paper illustrates several envisioned flows involving a self-sovereing indentity should have and self-sovereing indentity should have and applied in these title-cycles. In addition, the paper illustrates several envisioned flows involving a self-sovereing indentity should have and self-sovereing indentity should have and self-sovereing indentity should have and applied in these title-cycles. In addition, the paper illustrates several envisioned flows involving a self-sovereing indentity should have and self-sovereing indentity should have and self-sovereing indentity should have and and self-sovereing indentity is self-sovereing indentity.	theoretical; formalization; mathematical definitions;	introduce mathematical formalizations and new concepts to SSI
<u>65</u>	Self-sovereignty is a paradigm shift for digital identity that promises important benefits but lacks a definitional consensus. Herein, we validate nine properties of self-sovereignty proposed by credible sources, propose five new properties, and apply the features of our architecture for digital identity to reason about and validate these properties.	theoretical; new concepts;	introduce five new properties and refute three from Allen
<u>66</u>	Recent years have seen an increased interest in digital wallets for a multitude of use cases including online banking, cryptocurrent, yand digital identity management. Digital wallets in provide a practical desentralized and ordeninality, and or provide a grant in the secure approvide space. We seam as provide context of Self Sovereign Identity and provide a practical desentralized key recovery solution using Shami's secret sharing scheme and Hyperledger Indy distributed ledger technology.	application; wallet; key management; credential management; backup; recovery; group	digital wallet to store identity, keys, credential in secure enclave of mobile devices. Splits keys to multiple trusted peers for recovery
68	Self-sovereign ldentity (SSI) powered by distributed ledge technologies enables more flexible and faster digital identification vortificats, while at the same time limiting the control and influence of central authorities. However, a jobal identity Soution must be able to handle myriad credential types from millions of issuing organizations. As metadata about types of digital credentials is readable by everyone on the public permissionel keger with Hypertedger Indy, anyone could find relevant and frusted credential types for their use cases by looking at the records on the blockchain. To this date, no efficient Sulf-text search mechanism exists that would allow users to search for credential types in a simple and efficient fashion lightly integrated into their applications. In this work, we propose a full-text search framework based on the publicy available metadata on the Hypertedger Indy ledger for retrieving matching credential types. The proposed solution is able to find credential types is a scale to region and instanting a credential types in a scale on the matching is a scale on the total on the hord of only on information about credentials coming from a very large candidate pool of their dapte. Using a full-text website of a company displaying its own identifier and a list of issued credentials. We have also proven the feasibility of the concept by implementing and evaluating a prototype of the full-text credential metadata search service.	application; search; text- search; metadata; credential; attribute; claims; claims search; attribute search; credential metadata; claims metadata; meta;	introduced the problem of searching for claims/credentials metadata search and presented a solution for it
<u>74</u>	Digital identity systems has been around for almost as long as the computer and have envived with the increased usage of online services. Digital identities have traditionally been used as a way of authenticating to the computer systems at work, or apstroad online main. Today, our entire lives have a digital contentpart that become an integral part of everyday life. Self-Sovereigin letting (Ss) is the next sets in the evolution of digital identity management systems and distributed ledgers have provided necessary building blocks for Self-Sovereigin letting (Ss) systems. But what exactly is an Ideal Self-Sovereigin letting (Ss) systems. But what exactly is an Ideal Self-Sovereigin letting (Ss) systems. But what exactly is an Ideal Self-Sovereigin letting)? In this research we propose a definition and set of principies to characterizes the nature of successful SS systems. Based on our criteria and principies we present a systematic analytical study of the current SS landscage, represented by uPort, Soviri, ShoCart, and Criv. A system for truly self-sovereign lotting online identities are not yet archived in the current state of the field. It is our conclusion that it is paramount that a non-profit organization or academia take the reins on this effort and ellever a standardical way of managing online identities.	theoretical; definition; concepts; requirements	Rewrite Allen's ten principles focusing on why they are needed, removed Existence and added Unrestricted
82	Blockchain, which is a useful tool for providing tabla integrity, has emerged as an alternative to centralized servers. Concentraling on the integrity of the blockchain, many applications have been developed. Specifically, a blockchain can be ulticate in proving the user's identify using its strong integrity. However, since al data in the blockchain is, the ulticity available, it can cause privary problems if the user's identity using its strong integrity. However, since al data in the blockchain is, the ulticity available, it can cause privary problems if the user's identity is is the origin of the blockchain is the ulticity available. It can cause privary problems if the user's identity is is the strong integrity of the blockchain, it is difficult to transparently utilize encrypted user information in the blockchain. It were private information is employed in a privace private private integrity and the acception of the second set as a scharker (zero- knowledge Succinct Non-interactive ARgument of Knowledge). In our proposed SINS, the user information is employed in a privace private property of the zk-SNARK. We construct a SINS storeme and prove is security. We describe applications of SINS and demonstrate is practicably in through efficient righteemations.	application; definitions; proofs; implentation; identity creation; identity management; zero- knowledge proof; attribute claim; verifiable claim	A zero-knowledge proof system that creates identities and attributes, and statement/claims abo attributes without revealing them.
<u>99</u>	The self-sovereign identity (SSI) model entails the full responsibility and sovereignly of a user regarding his identity data. This identity data can contain private data which is solely known to the user. The user himself is therefore required to manage the whole files/cole of his private data, including the backup and restore. We also what prior work on how backup and restore the user's identity data data on the meet the requirements of the SSI setting, and we present the first solution which does meet the requirements. Authenticated backup with autions (AWARE) combines SSI sustaining aspects and extends them to create at any device. Sustaining aspects and extends possibility and a secure darrent. The backup and restore are audied by commits on a publicly accessible distributed ledger. These commits are answered by auding services which are required during restore. mechanism that thuy complex with the SSI nodel. We perform an in-degits travelyrisk is and or extender of VAMRE processible distributed ledger. These commits are answered by auding services which are required during restore. and-restore mechanisms, We instantiate the AVARE protocol with complex private and a secure data which is assisted performant backup. and-restore mechanisms. We instantiate the AVARE protocol with complex private protein assisted performant backup. and-restore mechanisms. We instantiate the AVARE protocol with complex privating a high security level of 256. We show its implementation results in the literature.	theoretical; application; recovery; restoration; backup; audit	trusted offline peers are used to backup data
<u>100</u>	Digital identity systems have been around for almost as long as computers and have evolved with the increased usage of online services. Digital identities have traditionally been used as a way of authenticating to the computer systems at work, or a personal online service, such as a near an identity and or everyday (iffe. Self-Sovereign) identity (SS) is the computer systems at work, or a personal online service, such as a near an identity and or everyday (iffe. Self-Sovereign) identity (SS) is the next step in the evolution of the digital identity management systems. The blockchain technology and distributed ledges have provided necessary building blocks and facilities, that bring us closer to the realisation of an ideal Self-Sovereign) identity? What are the characteristics? Trad-off? Here, we propose the inframework and methodology that can be used to evaluate, describe, and compare SSI systems. Based on our comparison oriteria and the evaluation framework, we present a systematic analytical study of existing SSI systems: uPort, Sovrin, ShoCard, Civic, and Blockstak.	theoretical; requirement; comparison; evaluation; characteristics	Introduce "usability" as a requirement
<u>104</u>	As centralized identity management solutions amass identity data, they increasingly become altractive targets for cyber attacks, which entail consequences for users that range from service disruptions to exposure of sensitive user data. Self-sovereign identity (SS) strives to return the control over identity data to the users by building on determitative architectures. However, the adoption of SSI systems is currently hangered by a lack of qualified betthy data tarts astiles the services (requirements Astidonal), there is a gap w.r.the user's privacy. Intermediate components (e.g., monotes or SSI network nodes) learn the users' sensitive attributes during the derivation of data. In this work, we present a decentralized at Deviation concept that preserves the users (privacy while manifating the data's trustworthiness without revealing the plain data to any component outside the users' control. Our proposed system also enables users to selectively disclose only relevant parts of the imported methy assertion according to the service's service's service's ser	application; identity; identity creation; import identity; identity derivation; adoption; integration	Introduced an identity derivation concept to import identity from conventional providers to SSI
<u>107</u>	requirements. We also implement and evaluate a proof-of-concept to demonstrate the feasibility and performance of our concept. There are too few systematic architecture designs for biockchain-based ball-soveneign identity (SSI) systems to support methodical development. We present an SSI platform that advances the notion of the design pattern as a service. We implement a prototype and evaluate it for feasibility and scalability.	-	introduced a series of design patterns considering the lifecycle of different components of a SSI system
<u>109</u>	More and more users are eager to obtain more comprehensive network services without revealing their private information. Traditionally, in order to access a network, a user is authorized with an identity and corresponding keys, which are generated and managed by the network operator. All users promotionally identifying information are centralized stored by the network, operator. All users promote have a set of their personally identifying information is centralized stored by the network operator. All users promote have the set of their personally identifying information are contralized and their they have been compromised. In this paper, we propose a blockhain-based identify management and authentication scheme for mobile networks, where users' identifying information is centrolized by the users themesistive. So use scheme time set-Severeign identifies (SSIs) and corresponding public keys and private keys. The private keys used to authenticate the user's identifying information is not obscheme to mobile to record SSIs and public keys of legitimate users and dupt charalesion has to detein legital users information on the block haard uncharaged. Turnemore, other service providers can obtain the user's SSI and public keys of authenticate users by querying the blockhain. Experimental results confirm that our scheme can greatly reduce the revealed on overhead and communication overhead.	application; distributed ledger; revocation; revocation list; chameleon hash; redactable blockchain	use chameleon hash to update a distributed ledge and remove false claims/users instead of requiring users to maintain a traditional revocation list
<u>110</u>	An identity management including authentication and authorization in a network environment is a critical security factor. Various models for identity management have been developed continually, from the silo model to the federated model and to the recently introduced self-sovereign interfly (SS) model. In particular, SS) makes users manage their own information by themselves independently of any organizations. SSI utilizes the newly summary buckets of it are in progress. However, SSI has not had wide public use because of its low compatibility and inconveniends. This is been progress a new bockmann based SSI model that postical and manuse process. To solve this problem, its pager propries are had backmann based SSI model that postical and manuse process. Our solve this problem is the progress of models are progress and the progress of models are progress. Users and clients who are familiar with the existing OAuth can easily accept the proposed model is expected to contribute to the exposition of obti the chondary and SSI.	oAuth; authentication;	blockchain bassed SSI system with oAuth 2.0 compatibility for easy integration with current applications

<u>231</u>	In a ubiquitos environment enclosing cooperative Internet of Things (ci)] devices, individuals, and entities, Digital identity Management (DIM) becomes critical and challenging. DIM pertains to device identifies authentication and verification to enable transvorts review eaching and all collection, and decision maing. DIM is the supporting pills for all onlines services and the foundation for security and authentication mechanisms. Due to the extreme heterogeneity, scale, and configuration complexity of such environments, enabling trustwortby DIM is curcial and services and the foundation for security and authentication mechanisms. Due to the extreme heterogeneity, scale, and configuration complexity of such environments, enabling trustwortby DIM is curcial and servicesly challenging. In an IoT context, devices use local (Digital dentities). Dis teroited within a tamper portion that internet authority or authentication. The recent attacks on IoT systems showed how vulnerable such a design is It is also an inherent problem that influences humans. From that, Self-Sovereign identity (SSI) has emerged as a decentralized DIM approach embracing the concept of potable selfpossession identity. SSI was presented to decouple the DI from the owner to enable targe-scales cooperation. However, DI storage and verification still court on the device and in a centralized manner. Utilizing a local single-point of failure storage memory for verificable credentials is one of the considerable drawbacks in contemporary SSI. In this regard, this paper introduces DTSIM, a novel Decoratized Trustworthy Self-Sovereign Identity Management Ericks to torhologies to provide transparent and trustworthy SSI-based conditials of the only of tori Similar o	IOT; credential storage; distributed credential; smart contracts verifiable presentation; multi-party computation; MPC	stores credentials elsewhere and use a SSS scheme with smartcontracts to manage VCs and VPs
233	Identity management is a principle component of securing online services. In the advancement of traditional identity management just provider manihed and a particular identity provider transmitted and traditional security pravadigm changed with the invention of block-tanh-based efficies (Stepsering) locations that primarily focus on the users. SSI reduces the functional scope of the identity provider to an attribute anyong ethic involves the invention of block-tanh-based efficies (Stepsering) locations that primarily focus on the users. SSI reduces the functional scope of the identity provider to an attribute provider while enabling matchine aggregation. Besides that, the development of new protocols, disregarding established protocols and a significantly fragmented landscape of SSI solutions pose considerable challenges for an adoption by service provides. We propose an Attribute Tustsert (ATB) to leverage the potential of SSI for trust-enhancing lattity backer (ATB) to leverage the potential of SSI for trust-enhancing lattity backer (ATB) to leverage the potential of SSI for trust-enhancing lattity backer (ATB) to leverage the potential of SSI for trust-enhancing lattity backer (ATB) to leverage the potential of SSI for trust-enhancing lattity backer (ATB) to leverage the potential of SSI for trust-enhancing lattity backer (ATB) to leverage the potential of SSI for trust-enhancing lattity backer (ATB) to leverage the potential of SSI for trust-enhancing lattity backer (ATB) abstrats from a decidated SSI solutions at the agregation approxer.	protocol integration; trust evaluation;	introduces an architecture to manage protocol integration (among various SSI offerings) and traditional ID protocols (SAML, OIDC) while evaluating trust/reputation models
<u>251</u>	With increasing digitization, more and more people use their identification credentials for accessing online services, which increases concern for data privacy. To ensure user's privacy, alternate credential management share users are included. Self-Sovereign loterhy (SSI) is a tom of ordential management where users are in charge of their credentials. Privacy-ricita data is stored at the user's end and they can choose to do selective disclosure of minimal required information to access services. Currently, SSI solutions are not being widely adopted by service providers and the exosystem is fragmented. One of the reasons for the lack of adoption is the need for maintaining privale infrastructure for credential issuence, as critical user information is to be handled during credential issues. To care the solution that enables the service providers to run their credential issues or called Credentials as a Service (CasSI). CasS issues run inside Trusted Execution Environments (TEE) enabling credential issuers to ensure user's privava while environments (TEE) enabling credential sources can be vice privated where user's private while only on the private isolations.	credential as a service:	Issue credentials remotly through trusted execution environment
<u>254</u>	Self-sovereign identity provides a feasible alternative to login via usemame and password through an identity provider to access digital services. It allows identity subjects to control and own their data. Although this is an appealing approach, it requires a whole new infrarouture with almost no dependencies on the existing none. We designed and mplemented a solution that combines an existing forestail distribution management solution with the new approach by enabling authentication via self-sovereign-identity based or redentials while the identity provider relations verification and communication with the service provider via Socurity Assertion Mark Up Language. This paper presents an OAuth-based method to delegate the processing and access policy management to the Authorisation Server thus allowing also systems with constrained IoT devices to benefit from DIDs and VCs.	OAuth 2.0 bridge; IoT	issues access tokens, which are then sent to IoT devices
324.10 35.1018	- The traditional centralized digital identity management system (DIMS) has been subject to threats such as fragmented identity, single point of failure, internal attacks and privacy leakage. Emerging blockchain technology allows DIMSs to be deployed in it, which largely alleviates the problems caused by the centralized third party, but its inhierent transparency and lack of privacy pose a huge challenge to DIMSs. In this regard, we leverage the smart contracts and zero-knowledge proof CZRP lagorithms to improve the existing claim indentity model in blockchain to relaze the identity unlinkability, reflectively avoiding the exposure of the ownership of attributes. Furthermore, we implement a system prototype named B2DIMS that includes a challenge-response protocol, which allows users to selectively disclose their ownership of attributes. To protect users' behavior privacy. Performance evaluation and security analysis show that our scheme achieves effective attribute privacy protection and a wide rappications core portugents in structures and the privacy transparence and and and security analysis show that our scheme achieves effective attribute privacy protection and a wide rappication scope compared with the service providers and the service privates and the service facility attribute privacy protection and a wide rappication scope compared with the service provider service privates and the service privates and the service facility attribute privacy protection and a wide rappication scope compared with the service provider service privates and the service privates attributes privacy privates and the service privates attributes privacy privates and the service privates attributes attributes privacy privacy head to be application scope compared with the service privates and the service privates attributes privacy privates attributes privacy privacy privacy head to be application scope compared with the service privates attributes attributes privacy privates attributes privacy privates attributes attribute	add new principles zkp; zk-snark; smart contract; blockchain; VP; selective disclosure	add new principles use zk-snark and smart contracts to create a selective disclosure VP
<u>35.1061</u>	the prior model. Recently, as el-sovereign identity model has been researched actively as an alternative to the existing identity models such as a centralized identity model, federated identity model, and user-centric model. The self-sovereign identity model allows a user to have complete control of his identity. He core component of the self-sovereign identity model is data minimization. The data minimized is esplicitly model is that minimized is a solution to data minimization, zero-knowledge proofs can be grafted to the self-sovereign identity model is self-sovereign identity model is self-sovereign identity model based on zs-SNARKs is allow any thut of the statement on an arbitrary relation. In this paper, we propose a privacy-preserving self-sovereign identity model based on zs-SNARKs to allow any type of data minimization beyond the self-device disclosure and range proof. The security of proposed models is formally proven under the security of the zero-knowledge proofs can be grafted is formally proven under the security of the zero-knowledge proof and the unforgeability of the signature in the random oracle model. Furthermore, we optimize the proving time by checking the correnses of the commitment outside of the proof relation for practical use. The resulting scheme improves priving time for hash computation (to verify a commitment multy) from 0.5 is about 0.1 ms on a 32-bit input.	zkp; sk-snark; VP; expressiveness; any language in NP;	allow VP with zk-snark to prove any language in NP
38.1026	Digital dentity is essential to almost all information systems. This paper provides a new perspective for reducing digital identity management systems (DIMS) to two mappings, the core operations on the mappings, and the trust model built around the mappings. Using this two-mapping varies we derive criteria for determining whether a DIMS solution is set of sovereign. We also compare descripticated identity management solutions with the traditional centralized identity management solutions with the traditional centralized identity management solutions. From the comparison and analysis, we have the following findings. The differences between determized identity management solutions are marked identity management solutions and herefore other operation-level differences. With a more trusteets trust model and torage scheme. Current decentralized solutions are analyzed based on the two-mapping view as well, which can provide useful directors to further study.	abstract; classification; evaluation	proposes a group of operations (CRUD + verification) despite identity and attributes (claims) and argues that a SSI system must support all of them
<u>38.1113</u>	This paper presents a design for a blockchain solution aimed at the prevention of unasithorized secondary use of data. This solution brings together advances from the fields of lentity management, confidential computing, and advanced data usage control. In the area of identity management, the solution is aligned with menying decentralized dentifiers (DIB), DID communication and verifiable credentials (VGa). In respect to confidential computing, the Cheor-Kim-Kim-Song (CKRS) fully homomorphic encryption, HEB) software is morporated with the system to protect the privacy of the individual's data and prevent transitionized secondary use with being statements. In the area of advanced data usage control, the solution invested to the obtained secondary uses and the privacy of the individual's data usage to the solution advanced and usage control. <u>38.1122</u>	When multiple entities communicate or collaborate in JointCouxi, identities are the very prior basis to build trust with each other. Desertralized identifier (DID) can provide a trusted identify with blockchain technology and a complete method of identity verification based on verifiable credentials, which solves problems of conventional centralized identify. However, current DIDs can only conduct verification within a single blockchain, which limits the interpretability of DIDs on different blockchains. Network isolation hinders the verification of DIDs on different blockchains and fluss there is a need to break the barrier between blockchains. In this paper, we propose a model to conduct cross-drain verification OIDs. We build a system of credit evaluation to describe the creditibility of DIDs in an effect work of blockchain. Internet cross-chain verification of DIDs. Experimental results wrifties the teability of the model, which realizes cross-chain verification of DIDs in the retwork of blockchains.	credibility; reputation; interoperability; cross- chain DID;	a creditibility evaluation using cross chain smart contract and the credibility of verifiers
<u>45.1004</u>	In this paper we present ZMaims: a system that allows users to present attribute-based credentials in a privacy-preserving way. We achieve a zero-knowledge property on the basis of Succinct Non-interactive Arguments of Knowledge (SNARKs), ZKaims allow users to prove statements on credentials issued by trusted third parties. The credential contents are never revealed to the verifier as part of the proving process. Further, ZKaims can be presented non-interactively, mitigating the need for interactive protofs between the user and the verifier. This allows ZKaims to be exchanged via fully decretized sent states and storages such as traditional peer-to-peer networks based on distributed hash tables (DHTs) or even blockchains. To show this, we include a performance evaluation of ZKaims and show how it can be integrated in decentralized detruices.	practical; claims; attributes; verification; proof; zero-knowledge proof;	a zero-knowledge proof system for presenting attributes (claims)
<u>45.1016</u>	Today, Uenity management is a key element for commercial and private services on the Internet. Over the past decade, digital identities envolved away from docentralized, pseudonymous, user-controled personas towards centralized, unabiquous disentities managed at and provided trough service privates. This development was sparked by the requirement of real identities in the context of electronic commercial and private services on the services of one and the past decade. digital identities and past data to the electronic commercial and private services on the services of one as sparked by the requirement of real identities in the context of electronic commercial and private services provides to people in order to establish social connections. The following centralization of dentities at a handful of service providers significant analyzed. For service providers, it is liability and the risk of facing significant punishment caused by dirict privacy regulations which hy to counteract the former. In this thesis, we investigate state -dfine private services providers, it is liability and the risk of facing significant punishment caused by dirict privacy regulations which hy to counteract the former. In this thesis, we investigate state -dfine services the following contributions: In order to allow uses to include to order the integrities. We propose a design for a decartitatized, deforming more service allowing contributions in order to allow uses and directly assections without the need of a trutset third party. Unlike existing research in this serve, we repose a design for a decartitatized, additionally more access control on heir organizations to establish trust relationships and identity assections without the need of contralized public key infrastructures (PKARC) public and identity assections without the need of contralized public key infrastructures (PKARC) substitute to use of secure name and on-interactive directly assections without the need of contralized public key infrastructures (PKARC) substitutes a	attribute delegation; name system; DNS	uses decentralized name system to control the delegation of authorization to issue credentials (or part of credentials)
<u>45.1018</u>	service. We provide proof of concept implementations of our designs and evaluate them to show that they are suitable for practical application. In many application domains, there is a need to ensure that users satisfy some requirements to use a versice. For example, there is a minimum age to buy alcoholic beverages or to watch some videos on YouTube. In these situations, organizations typically collect more personal information than necessary to provide a better service. The consequence is a personal data leakage that violates the data minimization principle stated by the General Data Protection Regulation 2016/679. This atricle proposes a new approach for allowing individuals to maintan control over the disclosure of their data, deciding which information to disclose and for how long. Our approach is bead on the use of social networks, and implementation on acebook is presented to show that the proposed solution is effective, cheap, fineful, and simple doub.		SSI on top of social networks
<u>58.1003</u>	and or how doing, our approach is based on in use or solution implementation or in ratectorial presented to show in use projects solution is enclave, cheap, intenzy, and simple to adopt. Most authentications orchemes are externely sensitive as unlike other credentials they cannot be renewed if compromised. This work proposes a blockchain based framework that allows secure, transparent, and privacy-present/jointeric authentication. Instead of shoring biointigo biointigo and the credentials they cannot be renewed if compromised.
