- [1] Quotes are typically paraphrased from Andre's telegram group and other sources. Links will direct you to the official review on cryptobriefing.com
- [2] Massive project that most aren't aware of. Smart contract platform built on Bitcoin which has huge potential. Some very solid partnerships.
- [3] Hashnet doesn't shy away from being a public version of Hedera Hashgraph. With many of the main features, and much better token metrics, it might be a great way to get exposure to the tech without paying up for it.

Ethereum smart contracts can be used on Hashnet, with the EVM hooking into HN.

[4] Lightstreams has borrowed its blockchain code (ethereum), its consensus mechanism (tendermint) and its privacy layer (IPFS), but has combined these to make an intriguing project with a punchy roadmap.

Token metrics are a strong point for Lightstreams, and its hype and marketing have picked up significantly. Token value should bode well with a roadmap with many near term milestones.

[5] Hashgraph is one of the most promising projects DLT has seen. It's patented technology means that investors in their tokens are protected from the possibility of network forks, and its governance network should make it palatable for adoption from major corporations.

Hardcap is massive, valuing Hedera Hashgraph in the billions, but in all honestly it may be the most legit project i've ever come across. Hearing Leemon Baird discuss the project is pretty incredible; it simply has too much potential to not get involved.

- [6] Very unique approach to scaling. Some questions around how this concept will test however. Need further due dilligence, but has promise.
- [7] Combines IPFS, Tendermint for consensus, Raiden for offchain transactions, Casper for sharding. Marketing itself as an IOTA killer.

Not a lot of originality, but could carve out a good niche. That said, a high valuation is hardly justified as most of its tech is borrowed and adapted.

[8] Fantom has an incredibly detailed whitepaper which meticulously describes the practicality of their DAG structure, its security features and scalability potential. Roadmap may be long, but its token metrics are good enough.

Real strength is in the networks potential performance features and the novelty factor of its structure. Fantom has already secured some very important partnerships which will impress the market and create realised utility.

Fantom's weakness is in its lack of code reveal.

[9] Constellation is an ambitious project using the SPECTRE protocol of consensus (developed by another company, DAG Labs). The team is passable, but roadmap quite drawn out and there has been a lack of progress updates.

Watch out for the testnet in July to see how this one performs, as a lot of DAG chains are emerging with impressive tests.
